Additional indicator under SDG 8.5

Employment-to-population ratio by sex, age and disability status

Note on available data

Data for global and regional monitoring for this indicator is reported by the International Labour Organization. The majority of ILO data for the employment-to-population ratio reflect nationally-reported data collected by the ILO Department of Statistics. The full dataset of available country-level employment-to-population ratios are disseminated at www.ilo.org/ilostat, under subject "Employment".

However, because not all countries report data in every year and, indeed, some countries do not report data for any years at all, the ILO has developed an econometric model to estimate missing values and generate global and regional estimates. The model-based country-level estimates as well as global and regional estimates of employment-to-population ratios produced are available at www.ilo.org/ilostat , under the subject "ILO Modelled Estimates".

The ILO database ILOSTAT currently has country-level data going back to 1947, and projections going until 2030. In most cases, data are disaggregated by sex and age groups (i.e. 15-24, 25+, 15+, 15-64, 65+). Estimates are produced at global, regional and country levels. . Regional and global estimates disaggregated by disability status are not currently available.
