

Dear Colleague,

After reading through the paper, I have to say, that Statistics Estonia welcomes and supports the aim of a generic national quality assurance framework. We hope that it will increase the transparency and coherence between statistical organizations around the world. We also hope that this framework is going to have clear links with the results of METIS workgroup on the field of Generic Statistical Business Process Model, as well as other frameworks developed within European Statistical System (e.g Code of Practice).

One more small idea about the document: I think it's not essential to add examples or specific experiences from different countries or organizations as annexes. In my opinion it burdens the document. Since this document is still a draft, I'm more that sure it was added to give a good example for additional comparison, thank you for that.

Kind regards,

Remi Prual
