17th MEETING STATISTICS, SWEDEN, STOCKHOLM
12-15 September, 2011

Forest income and capital accounting RECAMAN PROJECT

Pablo Campos and Alejandro Caparrós

Institute for Public Goods and Policies (IPP)

Spanish National Council for Scientific Research (CSIC)

**Department of Environment,
Autonomous Government of *Andalucía*, Spain**

- **Agroforestry Accounting System (AAS)**
- **Simulated Exchange Value (SEV)**
- **RECAMAN project**
- **Acknowledgements**

Agroforestry Accounting System (AAS)

- **Accounting for**
 - Flows: price x quantity
 - Capital: future discounted capital income flows

Main commercial values:

- Timber growth and felling (age structure)
- Cork growth and stripping
- Natural grass and acorn fodder
- Hunting (age structure)
- Mushrooms
- Others

Main environmental values :

- Public recreation
- Owner amenity self-consumption
- Forest landscape production
- Threatened biodiversity
- Carbon sequestration
- Others

Production account

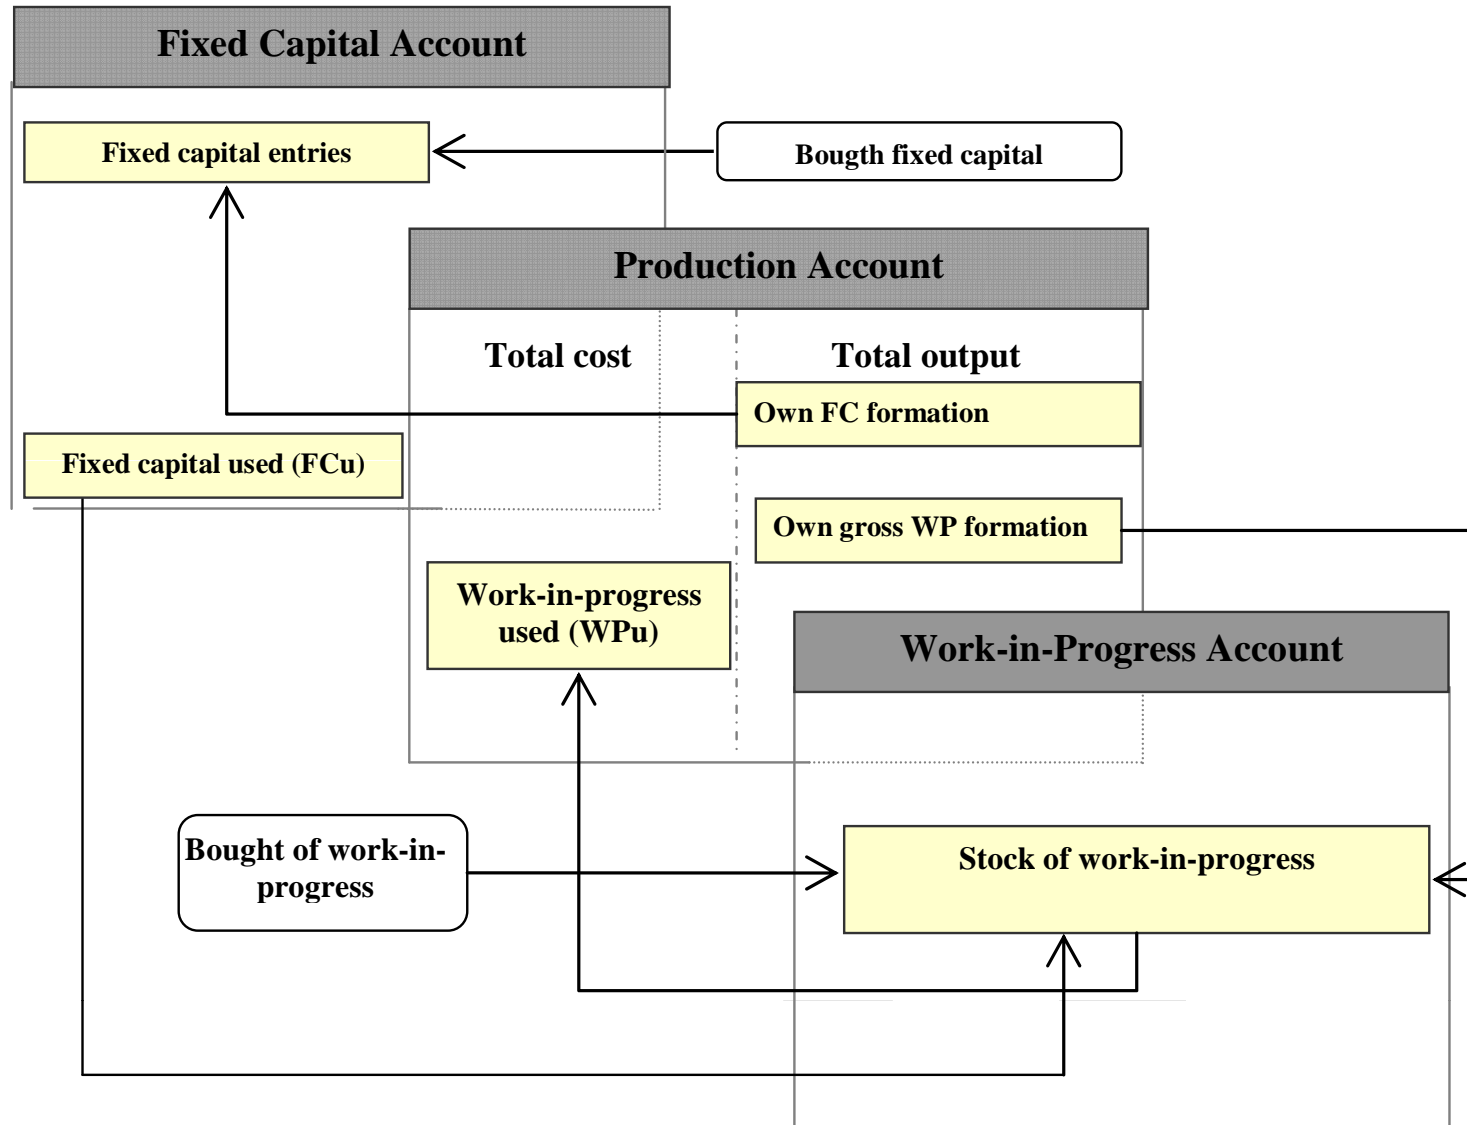

- **Total output**
 - SNA outputs
 - Non-SNA outputs (acorn, natural fodder, natural growth, hunting and scarce environmental values)
- **Total cost**
 - SNA costs
 - Non-SNA costs (intermediate output, works in progress used, carbon, government expenditures)

Capital (present discount values)

- **Work in progress balance sheet (inventories)**
 - Standing timber, cork and fuelwood
 - Game inventories.
- **Fixed capital assets balance sheet**
 - Land (timber, cork, acorn, commercial recreation, owner amenity self-consumption, carbon sequestration, landscape, threatened biodiversity, free public environmental recreation)
 - Biological resources (standing trees yielding repeat outputs and big game reproductive female, others).
 - Others

Production and capital accounts

AAS and SNA comparison

Class	Commercial goods and services		Environmental goods and services ¹	Total
	SNA (1)	Omitted (2)	(3)	AAS (4) = 1+2+3
1. Total output (TO) (1.1+1.2)	TO_{SNA}	$TO_{C,O}$	TO_E	TO_{AAS}
1.1 Final output (FO)	FO_{SNA}	$NG_{PR,FOR} + FO_{PU,C} + FO_{GAM}$	$FO_{a,E} + FO_{PU,E}$	PF_{AAS}
1.2 Intermediate output (IO)		IO_C	IO_E	IO_{AAS}
2. Intermediate consumption (IC)	IC_{SNA}	$WPU_C + IO_C + IC_{PU,C} + IC_{CIN}$	$IC_{PU,E}$	IC_{AAS}
3. Gross value added (GVA) (1-2)	GVA_{SNA}	$GVA_{C,O}$	GVA_E	GVA_{AAS}
4. Consumption of fixed capital (CFC)	CFC_{SNA}	$CFC_{PU,O} + CFC_{CIN}$	$CFC_{PU,E}$	CFC_{AAS}
5. Net value added (NVA) (3-4)	NVA_{SNA}	$NVA_{C,O}^1$	NVA_E	NVA_{AAS}
6. Capital revaluation (Cr) (6.1+6.2)		Cr_C	Cr_E	Cr_{AAS}
6.1 Working in progress revaluation (WPr)		WPr_C	WPr_E	WPr_{AAS}
6.2 Fixed capital revaluation (FCr)		FCr_C	FCr_E	FCr_{AAS}
7. Destruction of capital (Cd) (7.1+7.2)		Cd_C	Cd_E	Cd_{AAS}
7.1 Working in progress destruction (WPd)		WPd_C	WPd_E	WPd_{AAS}
7.2 Fixed capital destruction (FCd)		FCd_C	FCd_E	FCd_{AAS}
8. Capital adjustments (Caj) ²		Caj_C	Caj_C	Caj
9. Capital gain (CG) (4+6-7+8)		CG_C	CG_E	CG_{AAS}
10. Total income at market prices (TI) (5+9)	NVA_{SNA}	$NVA_{C,O} + CG_C$	$NVA_E + CG_E$	TI_{AAS}

AAS and SNA total income comparison

“From a theoretical point of view, [total] income is often defined as the maximum amount that a household, or other unit, can consume without reducing its real net worth” (SNA 2008, para. 8.25, p. 160).

$$TI_{AAS} = NVA_{AAS} + CG_{AAS} = NVA_{SNA} + NVA_{NSNA} + CG_{AAS}$$

$$NVA_{NSNA} = VAN_{C,O} + VAN_E$$

AAS Production account: NVA_{AAS}

AAS Capital balance account: CG_{AAS}

SNA Objective is narrower than AAS's: to measure market final outputs and costs and government non-market services expenditures yielding a *partial net value added* (NVA_{SNA}) and does *not measure* $VAN_{C,O}$, VAN_E and CG .

Forest Net Value Added of SNA

$$NVA_{SNA} = TO_{SNA} - IC_{SNA} - CFC_{SNA}$$

$$NVA_{SNA} = FO_{PR,SNA} - RM_{PR,SNA} - SS_{PR,SNA} - CFC_{PR,SNA}$$

$$FO_{PR,SNA} = FOe_{T,CO,F} + FOe_{PN,CN} + GFCF_{P,CON,EQ,PR} + FOo_{PR,SNA}$$

$FOe_{T,CO,F}$: Extractions of timber, cork and firewood.

$FOe_{PN,CN}$: Extractions of pine nut and chest nut fruits.

$GFCF_{P,CON,EQ,PR}$: Private (PR) own gross fixed capital formation of plantations (P), constructions (CON) and equipments (EQ).

$FOo_{PR,SNA}$: Other private SNA commercial forest final outputs.

Forest Commercial Net Value Added omitted by SNA

$$\mathbf{NVA}_{C,O} = \mathbf{NG}_{PR,FOR} - \mathbf{WPU}_{PR,FOR} + \mathbf{NVA}_{PU,C} + \mathbf{NVA}_{GAM}$$

$NG_{PR,FOR}$: Natural growth of timber, cork and firewood.

$WPU_{PR,FOR}$: Working in progress used of initial timber, cork and firewood extracted.

$NVA_{PU,C}$: Commercial public net value added from government direct management forest expenditures.

NVA_{GAM} : Game net value added.

Forest Environmental Net Value Added

$$NVA_E = TO_E - IC_{PU,E} = IO_{PU,E} + FOa_E + FO_{PU,E} - RMaf_{PU,E} - SSce_{PU,E}$$

$$FO_{PU,E} = FOR_{PU,E} + FOfl_{PU,E} + FOtb_{PU,E} + Fomu_{PU,E} + FOcf_{PU,E}$$

$IO_{PU,E}$: Public environmental intermediate output.

FOa_E : Land owner auto-consumption of private environmental services.

$FOR_{PU,E}$: Forest free visits recreation.

$FOfl_{PU,E}$: Forest landscape stated option value.

$FOtb_{PU,E}$: Forest threatened biodiversity stated existence value.

$Fomu_{PU,E}$: Forest mushroom collected by the public.

$FOcf_{PU,E}$: Forest carbon fixation by timber, fruit trees and shrubland growth.

$RMaf_{PU,E}$: Forest green water consumption by woody vegetations over grassland.

$SSce_{PU,E}$: Forest carbon emission by timber and shrubland extractions.

$$\mathbf{CG = Cr - Cd + Caj}$$

$$\mathbf{Cr = Cf + Cw - Ci - Ce}$$

Cr: capital revaluation from WP and FC balance sheets accounts.

Caj: Capital adjustments responds to the accounting rules for separating capital income on net operation margin/surplus and capital gain.

AAS and SNA Forest Private Total Income Comparison

$$TI_{AAS,PR} = TI_{PR,FOR} + TI_{PR,CIN} + FOa_E + TI_{PR,OO}$$

$$TI_{PR,FOR} = NVA_{PR,FOR} + CG_{PR,FOR}$$

$$NVA_{PR,FOR} = NVA_{SNA} + IO_{PR,FOR} + NG_{PR,FOR} - WPU_{PR,FOR}$$

$TI_{PR,OO}$: Other commercial income omitted by SNA.

$PI_{PR,FOR}$: Commercial intermediate output from livestock and game forest grazing of natural grass and fruits.

Simulated Exchange Value (SEV)

Environmental marginal values

- *Free public recreation*
- *Produced landscape*
- *Threatened biodiversity*
- *Owner amenity self-consumption*

Free access recreational services (demand)

Simulated Exchange Value Method

- **Simulated MARKET: demand and cost functions**
 - Monopoly
 - Perfect competition

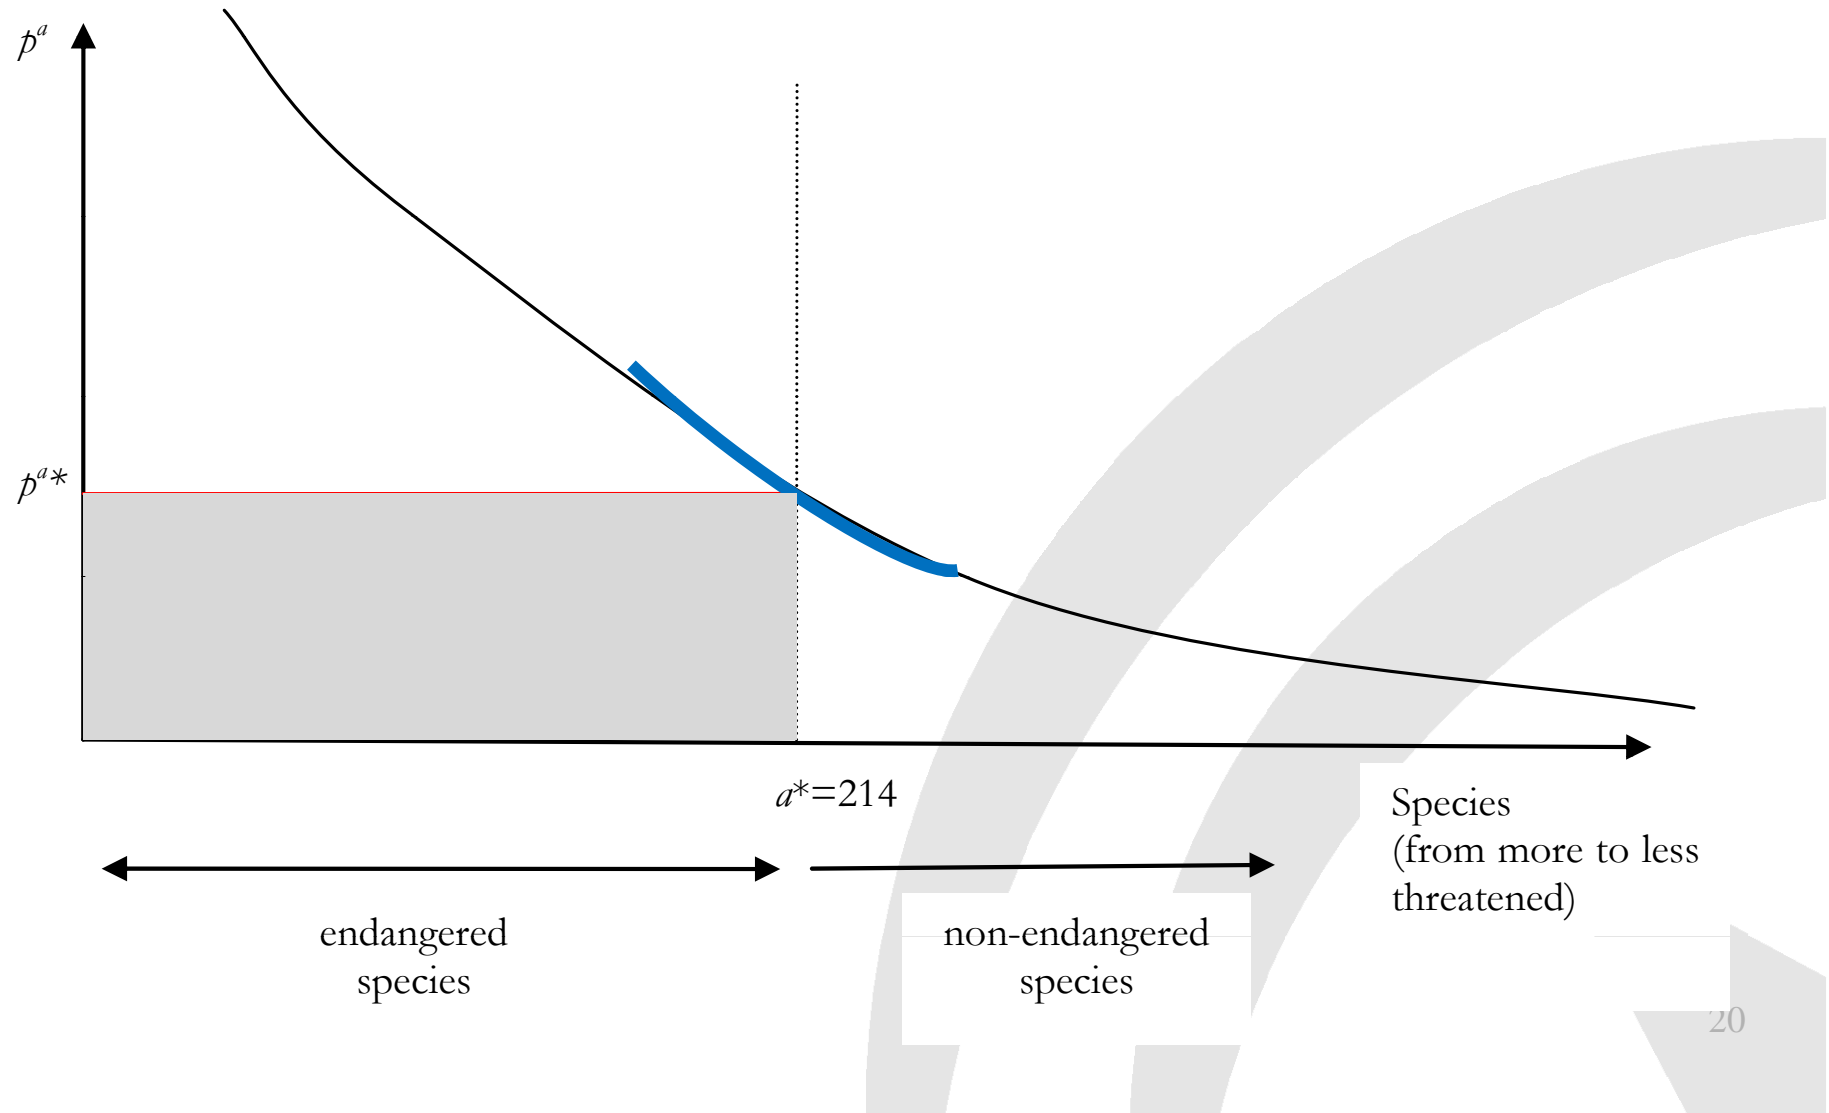

Endangered species: marginal valuation

- WTP to avoid the increase in endangered animal species (*linear only for presentation, actual function is obtained from a choice experiment using Latent Class techniques*)

Endangered species: marginal valuation II

Landscape values: marginal valuation

- WTP to increase one hectare of (e.g.) cork-oak in Cádiz (*linear only for presentation, actual function is obtained from a choice experiment using Latent Class techniques*)

Owner's amenity self-consumption I

- Recreational and other types of amenities consumed by the land-owner
- This value is capitalized in the market for land
- If enough data are available one can decompose the price (hedonic method) and then convert the capital value into an equivalent flow
- Since land transactions are not transparent enough we use contingent valuation
- This method allows to estimate directly flows

Owner's amenity self-consumption II

RECAMAN PROJECT

Mediterranean *Monte* Ecosystems

Total Income Green Accounting

RECAMAN Project

PROJECT COORDINATOR: Pablo Campos.

RESEARCHERS (44) AND INSTITUTIONS PARTICIPATING (12):

- Instituto de Políticas y Bienes Públicos (IPP-CCHS-CSIC): Begoña Álvarez-Farizo, Pablo Campos, Alejandro Álvarez, Alejandro Caparrós, Bruno Mesa, Paola Ovando, José Luis Oviedo and Nuria Ruiz (8).
- Museo Nacional de Ciencias Naturales (MNHN-CSIC): Cesar Luis Alonso, Mario Díaz and Elena Daniela Concepción (3).
- Estación Experimental de Aula Dei (EEAD-CSIC): Santiago Beguería and Roberto Serrano (2)
- Instituto de Estudios Sociales Avanzados de Andalucía (IESA-CSIC): Eduardo Moyano, Sara Pasadas and Carlos Priego (3).
- Centro de Investigación Forestal (CIFOR-INIA): Andrés Bravo, María Martínez, Gregorio Montero, María Pasalodos, Ricardo Ruíz-Peinado and Mario Soliño (6).
- Escuela Técnica Superior de Ingenieros de Monte de Madrid (ETSIM-UPM): Luis Díaz-Balteiro, Casimiro Herruzo, Carlos Romero, Ana Torres, and Roberto Voces (5).
- Facultad de veterinaria de la Universidad de Extremadura (FV-UEX): Juan Carranza, Pedro Fernández, José Manuel Seoane and Jerónimo Torres (5).
- Centro de Servicios Forestales de Castilla y León (CESEFOR): Fernando Martínez and Jorge Aldea (2).
- Escuela Universitaria de Estudios Empresariales de Soria /Universidad de Valladolid (EA-Emp-Soria-UVA): Pablo de Frutos (1).
- Université Montesquieu-Bordeaux IV: Marc Leandri (1).
- Agencia Andaluza de Medio Ambiente y Agua of *Junta de Andalucía*/División de Actuaciones en el Medio Natural: Isabel Martín, Luis Guzmán, María García and Samuel Gómez (4).
- Consejería de Medio Ambiente de la Junta de Andalucía/Dirección General de Gestión del Medio Natural: Francisca de la Hoz and José Ramón Guzmán (2).

PERIOD: 2008-2013.

TOTAL BUDGET FROM ANDALUCÍA GOVERNMENT: 8,219,415€

RECAMAN: Objective and Methods

- **Objective:**
 - **Developing and implementing** by the Government of *Andalucía* a **forestland and natural grassland ecosystems green accounting system (AAS)** for measuring **Hicksian Green Total Social Sustainable Income (TI) and capital (C)**.
- **Methods:**
 - Land cover unit: tree, shrub and natural grass.
 - Commercial good and services: SNA 2008 *criteria*.
 - Consumer surplus is not taken into account.
 - Environmental valuation criterion: simulated market exchange price.
 - Contingent valuation and choice experiment.
 - Production function
 - Agroforestry Accounting System (AAS).

Andalusian *montes* study case

Andalusian montes (61% forest, 21% shrubland, 10% natural grassland, and 8% other forestland) extend on 4.7 million hectares, which is 54% of *Andalusian* total surface (Source: SIOSE 2005 (Junta Andalucía, 2011)).

Ownership: 72% private and 28% public.

Montes estates over 300 hectares concentrate most of *montes* surface.

Andalusian *montes* are recognized as high nature-value ecosystems.

RECAMAM: Primary Data

- Forest National Inventory for forests and woodlands (age structure)
- Land cover and land use data GIS
- Prices of over 4,000 transactions per year on forest products
- Above 50 Revenues and costs in depth analysis of *montes* estates (including crops and livestock)
- 800 interviews to *montes* non-industrial landowners
- 4,000 interviews to free access visitors (CV and choice exp)
- 5,600 interviews to households (CV and choice exp)
- 800 interviews to hunters
- 800 interviews to *montes* hunting estates
- 4,000 interviews to mushroom gatherers
- Public expenditures on *montes* disaggregated by *montes* activities

Land: *timber, cork, fruit (acorn, chest nut, pine nut and wild olive), natural grass, game, environmental autoconsumption, mushroom, carbon, commercial recreation, public recreation, landscape, threatened biodiversity, and others.*

Biological resources: *trees yielding repeated timber products, trees yielding repeated non timber products, trees without cutting planning, reproductive and draught power livestock, big game females (except wild boar female), and others.*

RECAMAN: Results

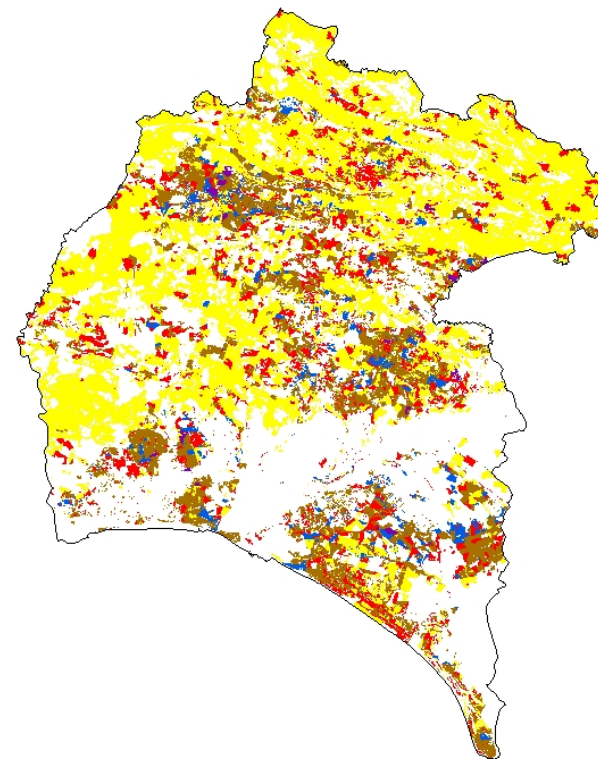

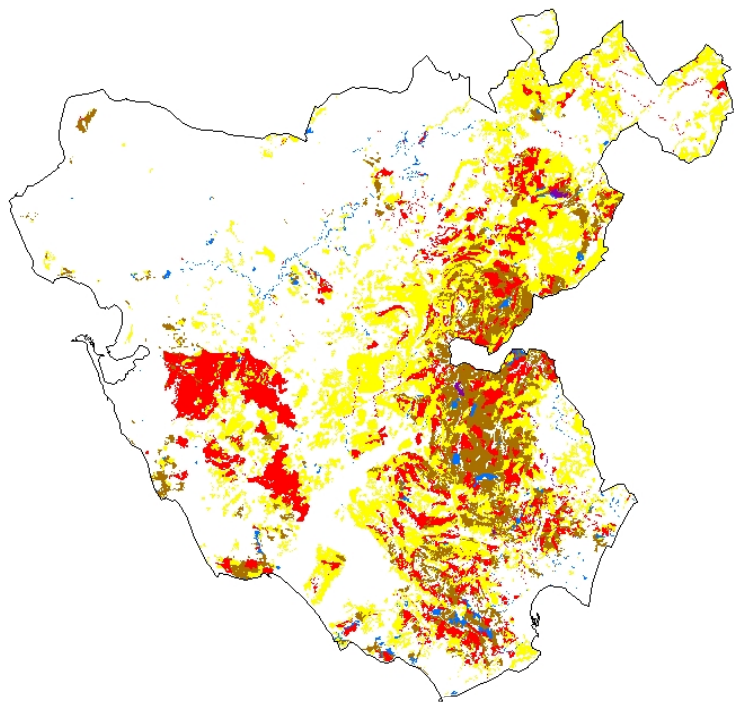

- Provisional results available in May 2012
 - Commercial and non-commercial values
 - Flow values and capital values
 - Spatially explicit results (2-3 ha SIOSE poligons/teselas) for $4.7 * 10^6$ ha
- Final results available from May 2013 onwards
 - Annual update of results thereafter

Results will be GIS based

Conclusions

- **Non-market valuation techniques** (CV, choice...) can be used for green national accounting to estimate demand functions which, together with appropriate costs functions, allow to **simulate markets** for non-commercial values (yielding *prices x quantity* estimates).
- The application to the Mediterranean *monte* in Andalusia (RECAMAN) proves the viability of the ***Simulated Exchange Value Method*** approach on a large scale for *free public recreation, produced landscape, threatened biodiversity and owner amenity self-consumption flow and capital values*.
- **Natural Ecosystems Hicksian Green TSI and Total capital** could be measured with **enough theoretical SNA consistency**; thus, avoiding waiting for the **golden measure** that probably will come much too late.
- **RECAMAN** provisional results available in May 2012 and **final results** available from May 2013 onwards (annual update of results thereafter).

ACKNOWLEDGMENTS

This presentation show the authors´ synthesis of the CSIC research Group on Environmental Economics (GEE) on agroforestry green accounting and our colleagues José-Luis Oviedo, Begoña Álvarez-Farizo and Paola Ovando have been contributed for many years to the content of this work and continue on the framework of RECAMAN project. In this occasion, we thanks the Andalusian Government for having given to the GEE the great opportunity to develop the RECAMAN project. We recognize the contributions of all colleagues and institutions collaborating in the RECAMAN project. Finally, we are the only responsible for the shortcomings that might remains in this presentation.
