Statistical Commission

Thirty-seventh session

7-10 March 2006

Item 3 (i) of the provisional agenda*

Items for discussion and decision: social statistics

Social statistics

Report of the Secretary-General

Summary

The present report was prepared at the request of the Statistical Commission at its thirty-sixth session. It summarizes the findings of *The World's Women 2005: Progress in Statistics*, which reviews and analyses the capacity of countries to report gender statistics to the international statistical system. The report also assesses progress made in the provision of gender statistics in the past 30 years. Stark disparities are identified in national statistical capacity to report such statistics. The report proposes actions and strategies for improving gender statistics worldwide. Points for discussion by the Commission are contained in paragraph 14.

* E/CN.3/2006/1.

I. Introduction

1. The present report prepared at the request of the Statistical Commission at its thirty-sixth session,¹ reviews and analyses the current availability of data and assesses progress made in the provision of gender statistics in the past 30 years. It highlights, among other things, the importance of building and sustaining national statistical capacity to improve gender statistics. The report draws from the recent publication, *The World's Women: Progress in Statistics*, produced by the Statistics Division, Department of Economic and Social Affairs.

2. The focus is on the reporting of statistics on women and men by countries to the international statistical system. The main sources of data used to analyse countries' ability to produce and report information on gender included the Statistics Division of the Secretariat; the United Nations Educational, Scientific and Cultural Organization (UNESCO) Institute for Statistics; the International Labour Office; and the World Health Organization with inputs from the United Nations regional commissions.

II. Need for gender statistics

3. The Commission on the Status of Women, in its 10-year review of the Beijing Platform for Action, noted that the activities for the advancement of women had been limited partly by the lack of gender statistics and data disaggregated by sex and age and, in many areas, inadequate methods for assessing progress.² The timely availability of reliable statistics on the situation of women and men is critical for Governments to successfully measure progress or lack thereof in the quest for equalization of opportunities between women and men, girls and boys.

4. In 1995, the Fourth World Conference on Women called in its Beijing Declaration for a more comprehensive approach that incorporated a gender perspective into national statistical systems to ensure that gender statistics adequately demonstrated the particular and often different experiences of women and men in society.³

5. It is against this background that *The World's Women 2005* analyses the extent to which the growing demand for gender statistics is being met by Governments. This is done by assessing national statistical capacity to report gender statistics to the international statistical system. It looks at the extent to which official national statistics, as differentiated from internationally prepared estimates, are available in various areas of concern. By focusing on the national reporting of gender statistics, *The World's Women 2005* provides stakeholders with information to assess progress, identify gaps and design strategies to improve the collection, analysis and dissemination of statistics needed at the national level for monitoring national development and internationally agreed goals pertaining to gender concerns.

III. National capacity to report statistics

6. In general, the analysis shows a sharp disparity in reporting between geographic regions and across development groups that are reflective of the differences in overall national statistical capacity. A contrast is apparent with, at the

one end, countries that have a strong capacity to collect, analyse and report the requisite statistics disaggregated by sex and age, and at the other, those whose statistical capacity is limited, and who therefore do not collect and report timely gender statistics at regular intervals. A number of countries are in between these extremes, with moderate statistical capacity.

7. The overall reporting of gender statistics on various topics is strongest in Europe, followed by North and South America. Moderate levels of reporting are evident in Oceania and for some topics in Asia. Africa shows the weakest capacity to report the requisite information. The contrasts in reporting, however, are greatest among development groups. The least developed countries⁴ are the most lacking in statistical capacity and the ability to report gender statistics in all areas reviewed by *The World's Women 2005*.

8. For example, the report shows that virtually all countries in the developed regions conducted a population census between 1995 and 2004 and reported vital statistics on births and deaths from a civil registration system with 90 per cent or better coverage. Most countries in the less developed regions, excluding the least developed countries, also conducted a census during the same period. However, only about half reported vital statistics from civil registration systems with 90 per cent or better coverage. Among the least developed countries, only 34 out of 50 conducted a population census, and just 2 reported vital statistics from a sound civil registration system.

IV. Status of reporting of specific gender statistics

9. The areas covered include population, households and families; health; education; work; violence against women; and poverty, power and decision-making and human rights. A total of 204 countries and areas are included in the review. The tables in the annex to the present report give the number of countries or areas in each geographic region and development group that reported statistics between 1995 and 2003.

(a) *Population, households and families.* Compared to the number of countries reporting total population, a smaller number reported the information by sex and sex and age. Of the 154 countries or areas in the more developed regions and the less developed regions, excluding the least developed countries, 134 reported statistics on population by sex and age at least once during the period 1995-2003. Among the least developed countries, 17 out of 50 countries reported such statistics. Africa was the region with the lowest number of countries, 23 out of 55, reporting statistics on population by sex and age at least once during this period. The report also analyses the national reporting of births, marriages, divorces and households. While international migration is not included in the analysis, it is recognized that migration is increasing in importance and needs to be considered in future reporting and analyses;

(b) *Health.* The health status of a population is, ironically, often reflected and measured by information about deaths. The analysis shows that during the period 1995-2003 basic statistics such as the number of deaths of women and men and girls and boys were not reported for many countries and areas. Of 204 countries and areas about 121 and 109, respectively, reported the number of deaths by sex and age and number of deaths by cause, sex and age at least once between 1995 and

2003. While total infant deaths were reported by 143 countries or areas, only 114 reported infant deaths by sex. Almost all countries in the more developed regions reported the number of deaths by cause, sex and age at least once during the period under consideration. In contrast, 3 out of 50 least developed countries reported such statistics on deaths and 5 out of 55 countries in Africa reported such information. The reporting of emerging health concerns such as HIV/AIDS as a cause of death improved during the period 1995-2000. About 68 countries or areas reported deaths due to AIDS by sex and age in 2000 compared with 38 in 1995. With respect to disability statistics, at least 80 countries collected disability data in the 1990s and more than 70 countries included a question on disability during the 2000 round of population censuses. Since then, initiatives have been mounted to develop and collect internationally comparable disability statistics through censuses and surveys;

(c) *Education.* Since 1995 most countries have been able to report the number of students enrolled in primary and secondary school, but less than a quarter have reported school attendance. Of 204 countries and areas, 138 and 101, respectively, reported, at least once, the number of girls and boys, by age, enrolled in primary and secondary school between 1998 and 2001, while only about 40 countries or areas reported school attendance by sex and age. Analysis by region revealed that most of the countries in each region were able to provide enrolment data by sex for primary and secondary education. There were, however, important differences in the reporting of census data on school attendance by sex and age among geographic regions and across development groups. A greater number of countries in Europe and Asia reported school attendance by sex and age, while this was not the case in Oceania and Africa. In the case of development groups, greater reporting of census data on school attendance was apparent among countries in more developed regions and the lowest among the least developed countries;

(d) *Work.* Worldwide availability of statistics on economic activity, employment and unemployment is still not very satisfactory. About 125 of 204 countries or areas provided data on the economically active population by sex and 123 of those further disaggregated the data by age. The ability to report varied greatly according to geographic regions, with Africa the least able to report any data related to work. More than half of the countries in Europe, Asia, North America and South America reported data by sex on the economically active, employed and unemployed population at least once between 1995 and 2004. When, however, more detailed breakdowns of data were requested, the number of countries reporting such data dropped. This is the case for wage employment by sex and major industry group, the specific data needed for calculating the millennium development goal indicator, "share of women in wage employment in the non-agricultural sector". Only 74 of the 204 countries provided such data at least once in the past nine years. Time-use studies helped to better capture data on women's paid and unpaid work. Since 1995, at least 67 countries carried out time-use surveys. This includes 33 countries in the less developed regions;

(e) *Violence against women.* There is a general lack of reliable data on the various forms of violence against women. It should be noted, however, that since 1995 there has been some progress in the development of methodology and procedures for data collection on violence against women, in particular intimate partner violence. Since then, initiatives have been mounted to develop and collect internationally comparable statistics on violence against women through surveys. At least 68 countries have conducted such surveys;

(f) *Poverty, power and decision-making and human rights.* In many countries, mainstream statistical agencies and programmes do not routinely collect, compile and disseminate gender statistics under such topics as poverty, power and decision-making and human rights. Regular and sustained collection and reporting of data in the above-mentioned areas has been constrained by a lack of statistical capacity and poorly developed concepts and methodologies, which have contributed to the limited use of existing data to examine gender-based differences in these areas.

10. A review of three periods, 1975-1984, 1985-1994 and 1995-2003, indicates that progress in reporting of official national statistics was minimal. The assessment of progress for the most recent period was partly inconclusive owing to delays in national reporting of the requisite statistics. Considering the number of countries or areas that reported sex and age disaggregated statistics for at least one year and for at least five years in each of the above-mentioned time periods, results showed that fewer countries were able to report frequently (for at least 5 out of the 10 years) their annual data by sex and age. However, frequent reporting of annual data on the economically active population by sex and age improved over the three time periods. *The World's Women 2005* also notes that more countries now have data on violence against women, the participation of women and men in the informal sector and time use for women and men. Notwithstanding some improvements in data collection in these areas, the studies are mainly ad hoc and not mainstreamed into the regular national statistical work programmes.

V. Factors contributing to the paucity of gender statistics

11. The general lack of data to address gender issues and the differences in availability of such data across regions and across topics is partly a reflection of the following three factors:

- (a) Inadequate statistical capacity;
- (b) Lack of gender mainstreaming in national statistical systems;
- (c) Inadequate concepts and methods used in collecting and, to some extent, analysing gender statistics.

VI. Actions and strategies to improve gender statistics

12. *The World's Women 2005* identifies three key actions necessary for improving gender statistics and proposes strategies for implementing each action. The actions are: strengthening national statistical capacity, gender mainstreaming in national statistical systems and development of appropriate concepts and methods for collecting and analysing gender statistics:

- (a) **To strengthen national statistical capacity the following strategies should be adopted or implemented:**
 - (i) ***Ensuring sustained commitment at the highest levels of government to strengthen statistical systems.*** Governments should ensure that statistics be given due priority. For example, in order to have a coordinated approach to the production of a core set of socio-economic statistics required for

policy formulation and planning, Governments should strive, to the extent possible, to support the implementation of at least one population and housing census every 10 years; to establish and maintain a civil registration and vital statistics system; and to ensure the sustainability of an integrated national sample survey programme;

(ii) *Building capacity in data presentation.* Producers of gender statistics need to be more proactive in making the value of gender statistics visible to Governments, the general public and other stakeholders by using more user-friendly ways of presenting and disseminating data in different formats. This could help maximize the use of data and in the process create a demand for statistics that would strengthen the claim of statistical offices on the national budget;

(iii) *Developing human resources in national statistical systems.* Women and men should be given the same opportunities for training and career development within the national statistical system;

(b) Mainstreaming a gender perspective into the national statistical system should encompass all aspects of the production of statistics, from the development of concepts, methods of data collection, analysis and dissemination of results. The following, are among the strategies that could contribute to attaining the above-mentioned goal:

(i) *Supporting gender statistics units.* National statistical offices could benefit from the establishment and retention of gender statistics units. The units could play a catalytic role in initiating and monitoring the process of gender mainstreaming in the national statistical systems;

(ii) *Fostering dialogue between producers and users of gender statistics.* The dialogue between the national statistical office and women's groups could, for instance, increase the capacity of statisticians to identify and understand gender issues and to present data in formats that better address users' needs. User involvement could be beneficial to national statistical offices in gathering support for collecting statistics in new areas. The dialogue could also contribute to the building and sustenance of stakeholders' interest in the production and dissemination of statistics and the development of a national statistical capacity. It could also enable women's groups and gender advocates to understand, gain access to and use gender statistics more effectively;

(iii) *Using administrative data sources.* These sources are in most cases underutilized. However, with the introduction of appropriate changes in the methods of data collection and analysis, the resulting statistics could be used in gender analysis;

(c) Developing and improving concepts and methods in gender statistics is essential for the improvement of gender statistics both in quality and quantity. International and regional organizations and specialized agencies, national statistical offices and other research institutions need to work together to develop and revise concepts, definitions and methodologies for use in data collection in areas where such standards and methods are lacking.

13. To improve the lives of both women and men, in the long run, statistical systems and budgets at the national as well as international level must bring about the sustained and institutionalized change needed to ensure the availability of quality gender statistics.

VII. Points for discussion

14. The Commission may wish to consider the issues outlined in the present report together with information contained in the annex tables. In addition, the Commission may wish to discuss and comment on the national actions and strategies proposed in paragraphs 12 and 13, aimed at improving the availability of gender statistics worldwide.

Notes
