

Estimating Use Tables

Introduction plus Benchmark and Annual Process

Gabriel Medeiros

International Workshop on Supply and Use Tables

Beijing, Sept 11-13

- Process is guided by the availability of data
 - Benchmark (every five years)
 - Annual
 - Quarterly

Benchmark Sources

Core Data source: Economic Census

- Measures almost the whole universe of establishments with 5 or more employees

Supplemented with data from:

- Business Expense Survey (BES)
- Economic Research Service (ERS)
- Bureau of Transportation Statistics (BTS)
- Census of governments.

Non-employer establishments data supplemented with administrative data.

Census Sources

Output Details for item...

5412131 Tax preparation services

Output Total:

3899.1

Annual Sources

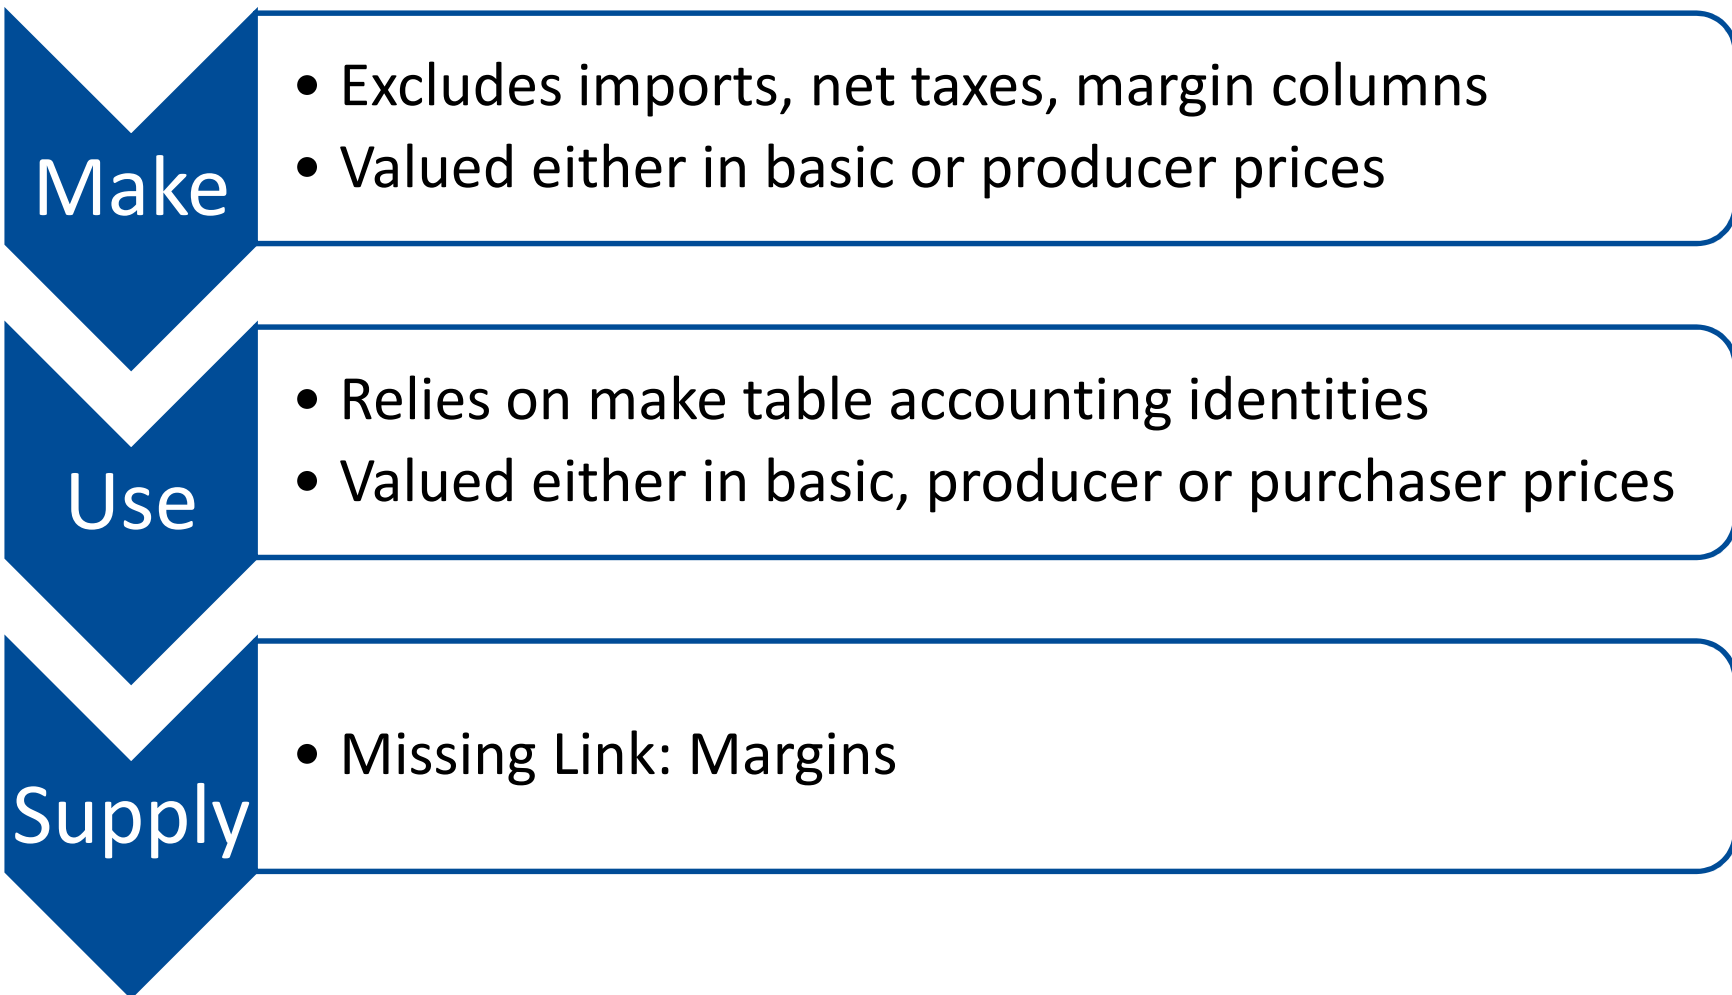

Other Census Bureau programs:

- Annual Surveys; examples:
 - Annual Retail Trade Survey (ARTS)
 - Annual Wholesale Trade Survey (AWTS)
 - Service Annual Survey (SAS)
 - Annual Survey of Manufactures (ASM)
 - Annual Survey of Government Finances (ASGF)
- Value of Construction Put-in-Place (VPIP)
- Business R&D and Innovation Survey (BRDIS)
- Special Tabulations

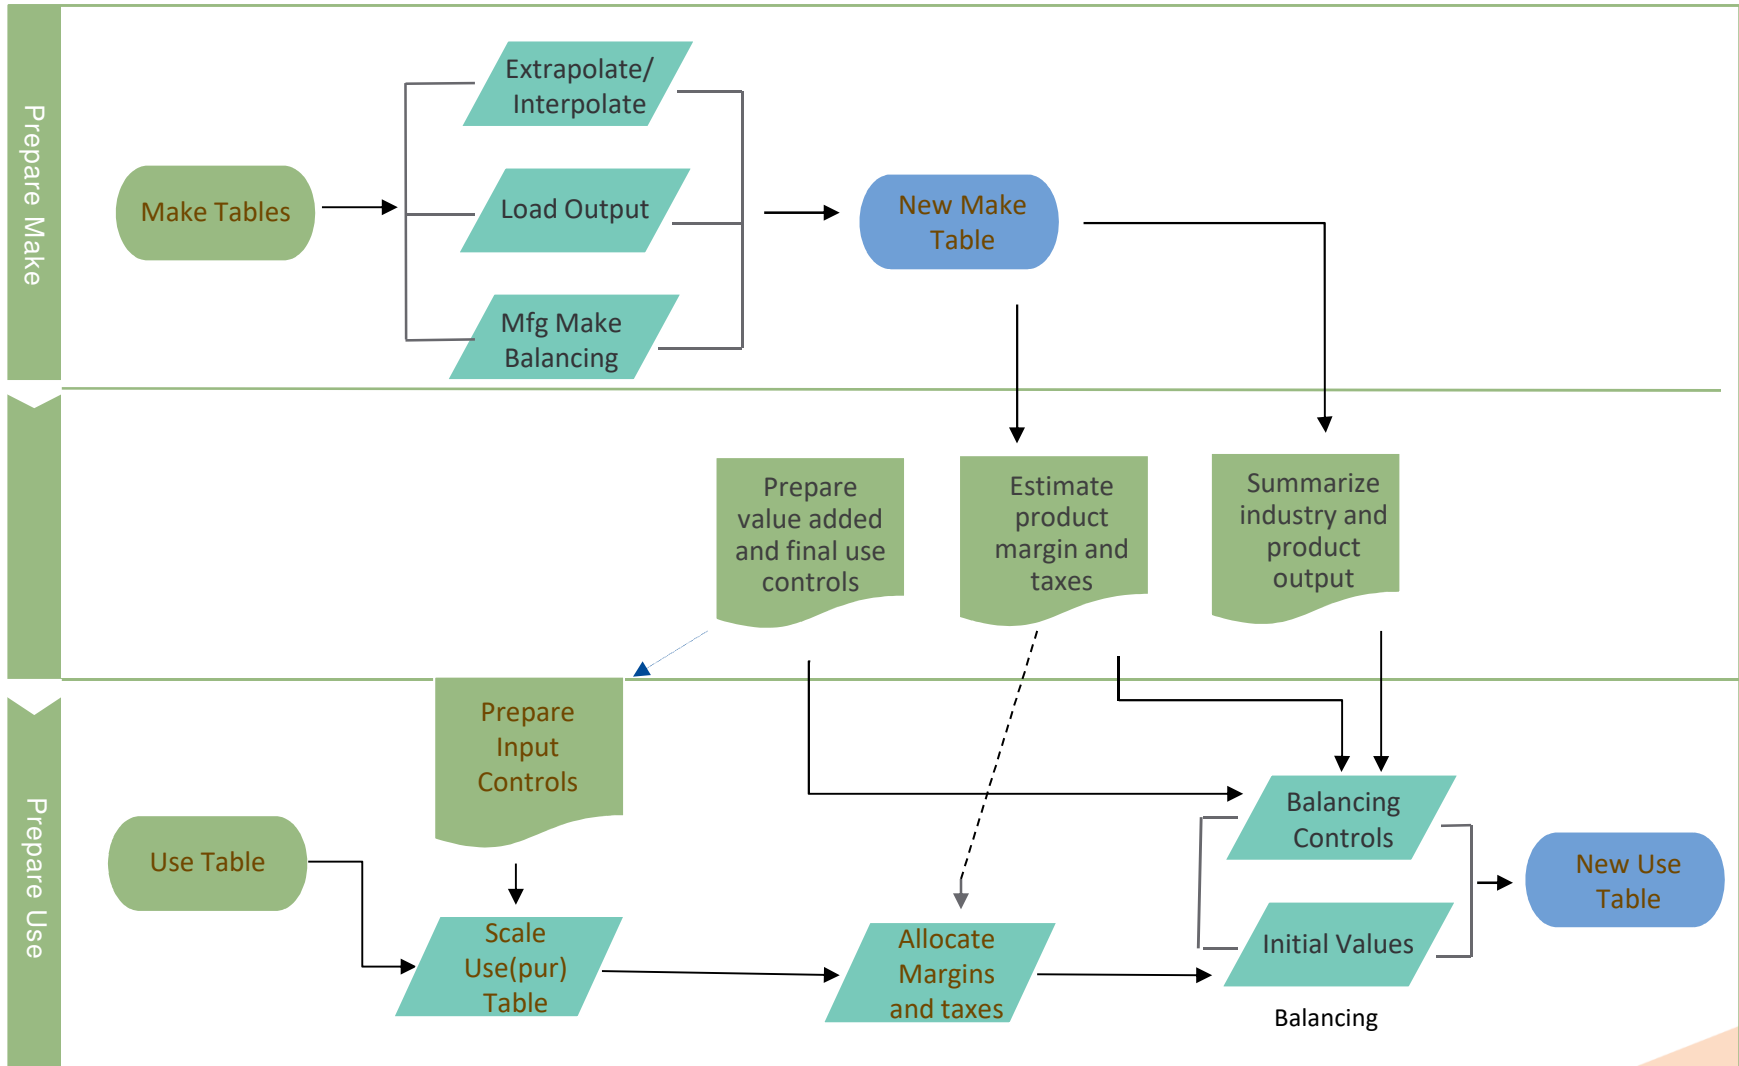

Non Census Bureau programs:

- ERS, BTS

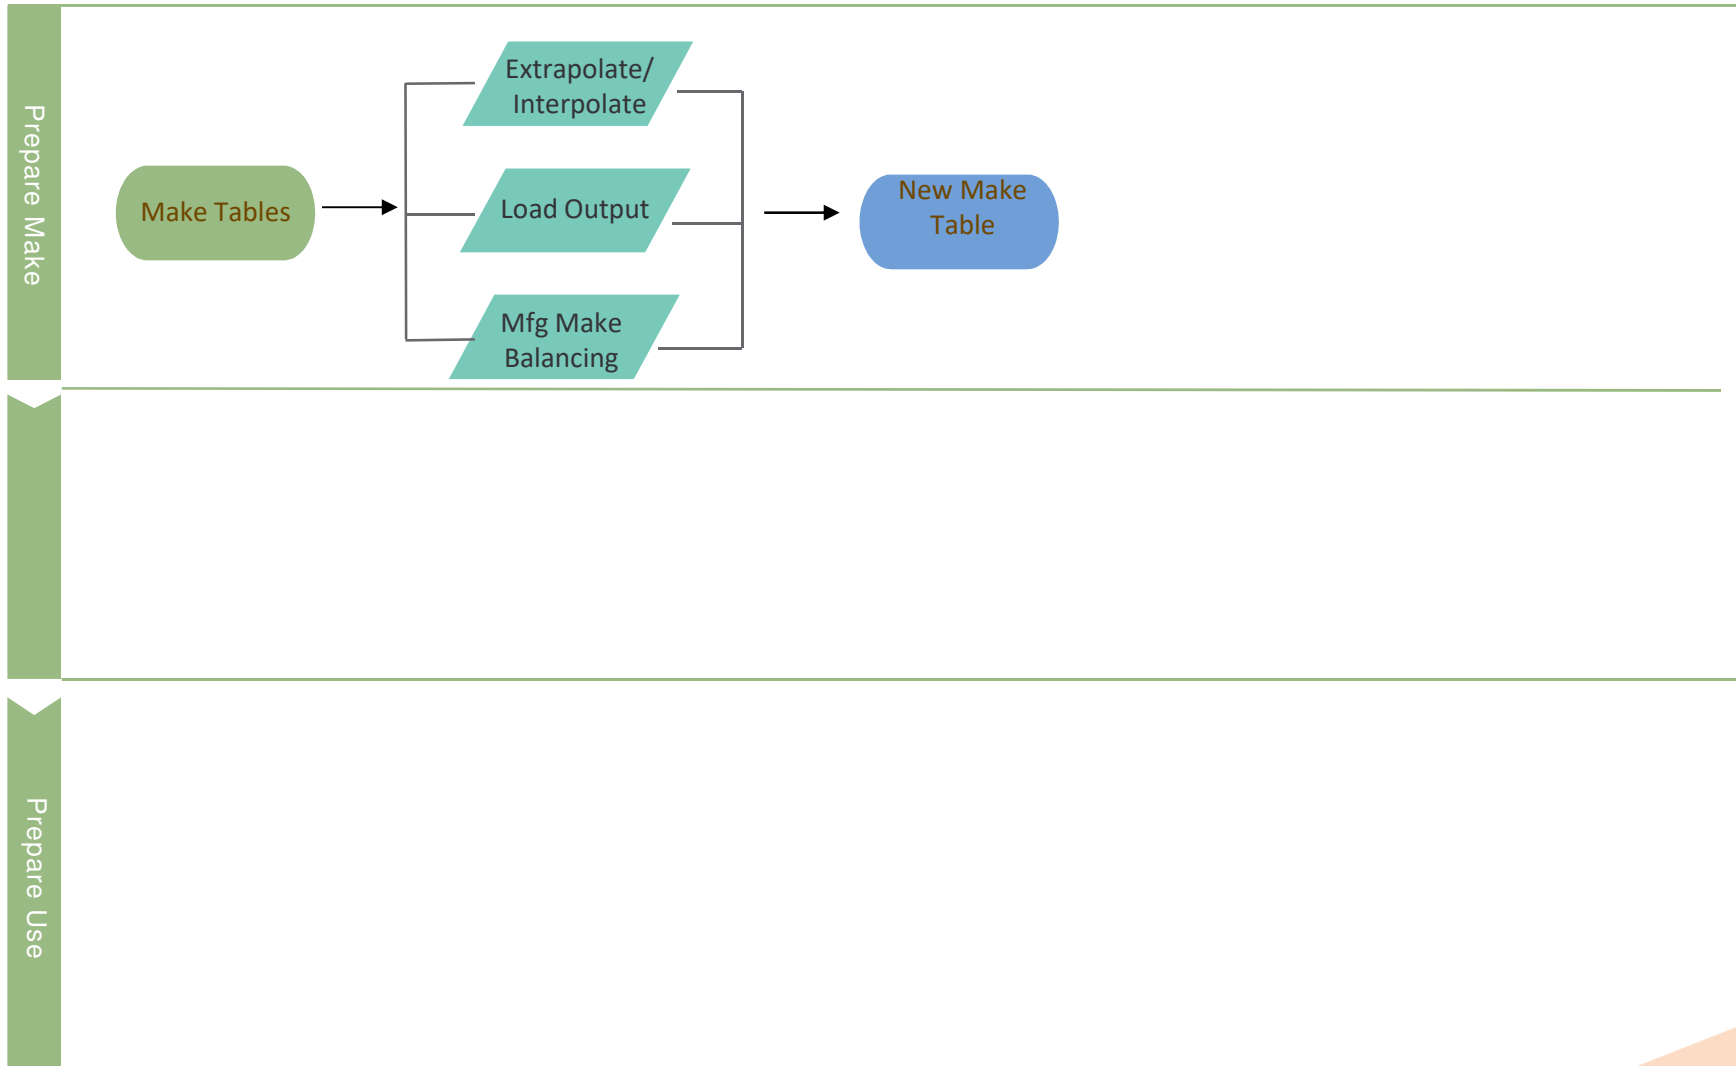

US Methodology – Computing Supply Tables

Sample Level of Detail for Retail Margin Controls

New autos--PCE

New trucks--PCE

Used autos

Used trucks and vans

New autos-PDE

New trucks--PDE

Mobile homes

Recreational vehicles, parts, and trailers

Furniture and fixtures

Major kitchen & household appliances

China, giftware, glassware, tableware, utensils, and decorative home furnishings

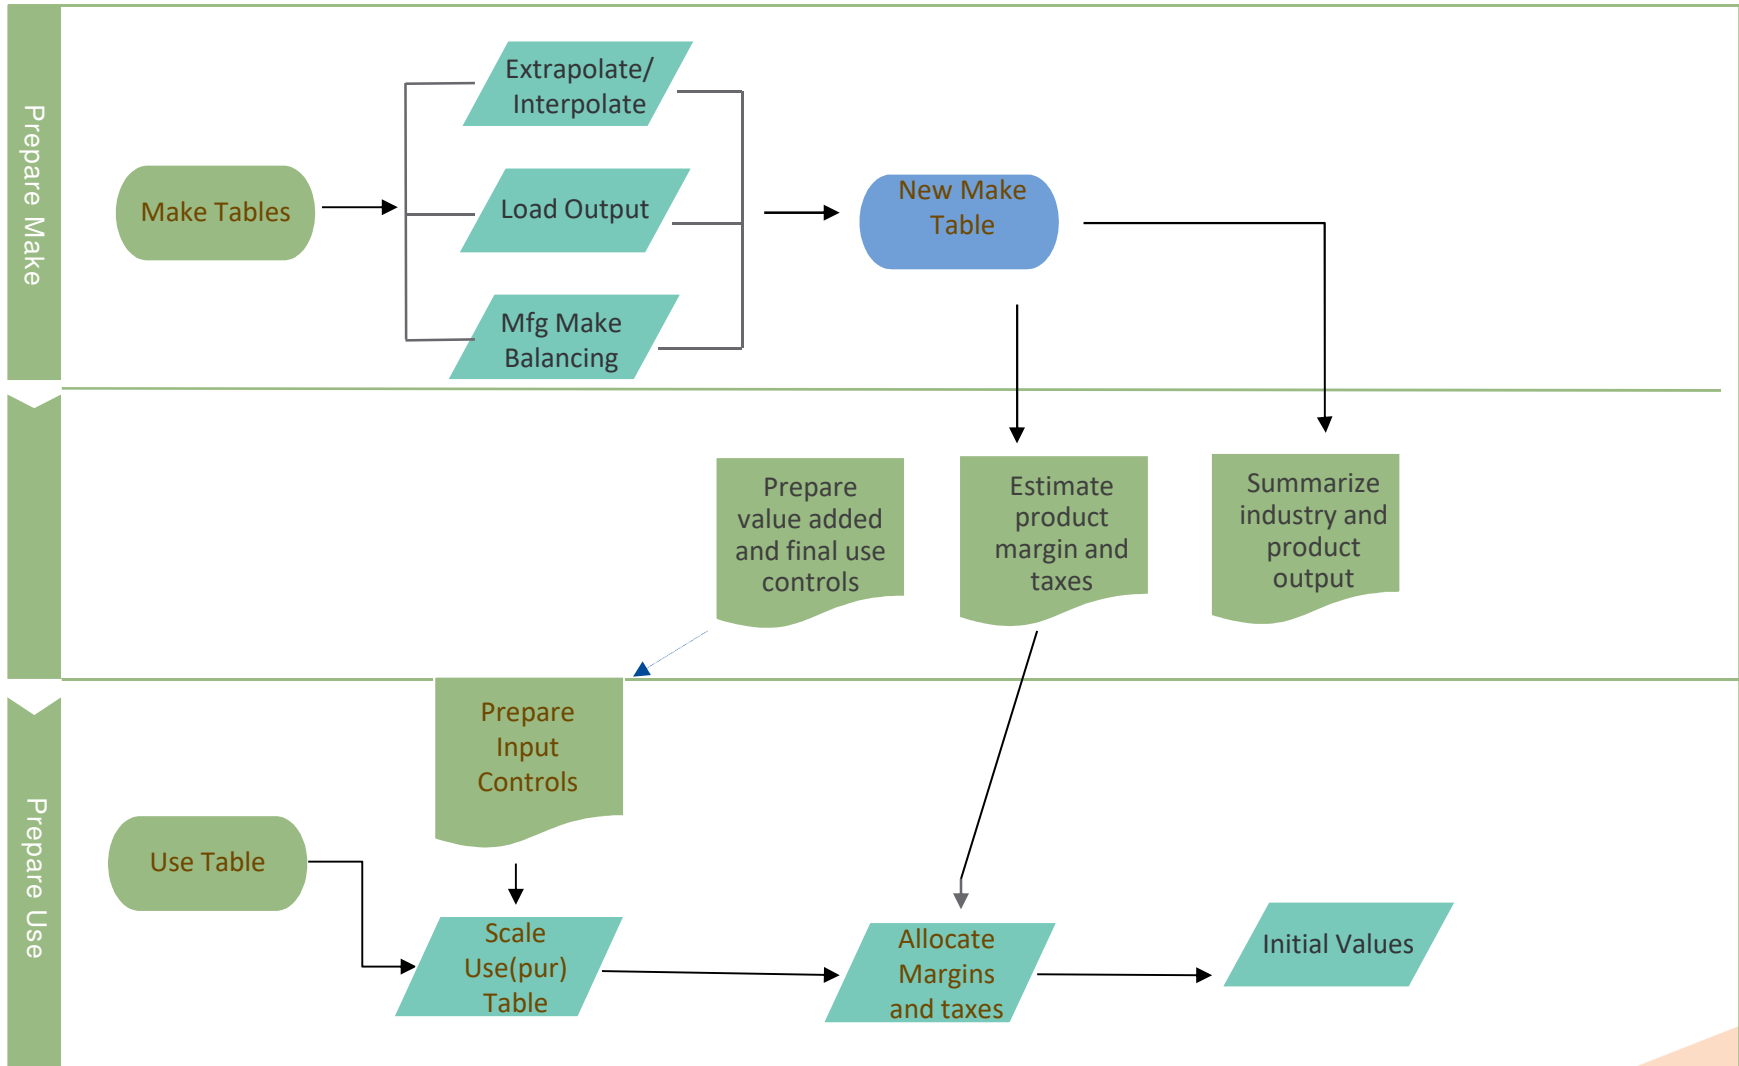

Floor coverings

Telephones and other durable house furnishings, n.e.c.

Office equipment and writing equipment (excl computer equipment)

Ophthalmic products and orthopedic appliances

Production Flow: Annual

Example: Scaling Use table to Expense Controls

		Industries		Final Demand
Commodities	Margin	95	95	50
		53	25	60
		12	15	5
	Basic	875	800	500
		490	250	600
		1,100	950	500
Value Added		415	1,300	

1,100	1,320
1,560	1,010

		Industries		Final Demand
Commodities	Margin	108	107	50
		50	28	60
		11	16	5
	Basic	992	903	500
		462	282	600
		1,037	994	500
Value Added		415	1,300	

- Scale to expense controls
 - Expense controls span multiple commodities, and often span multiple industries
 - Expense controls are valued at purchaser prices, and margin cells are scaled jointly with underlying basic value cells to match the controls
 - Source data for intermediate input controls largely based on data from the U.S. Census Bureau.

Retired Methodology: Quantity and Price Extrapolation

Prior to scaling use table records to expense controls, use table records were first adjusted as follows:

- Impute a real growth based on the real growth of output for the purchasing industry.
- price growth based on the average price growth of the given commodity/product.

$$p_t q_t = p_{t-1} q_{t-1} * \Delta q^{GO} * \Delta p$$

This step in the process was abandoned because resulting real value and input-output coefficients were not noticeably different without it.

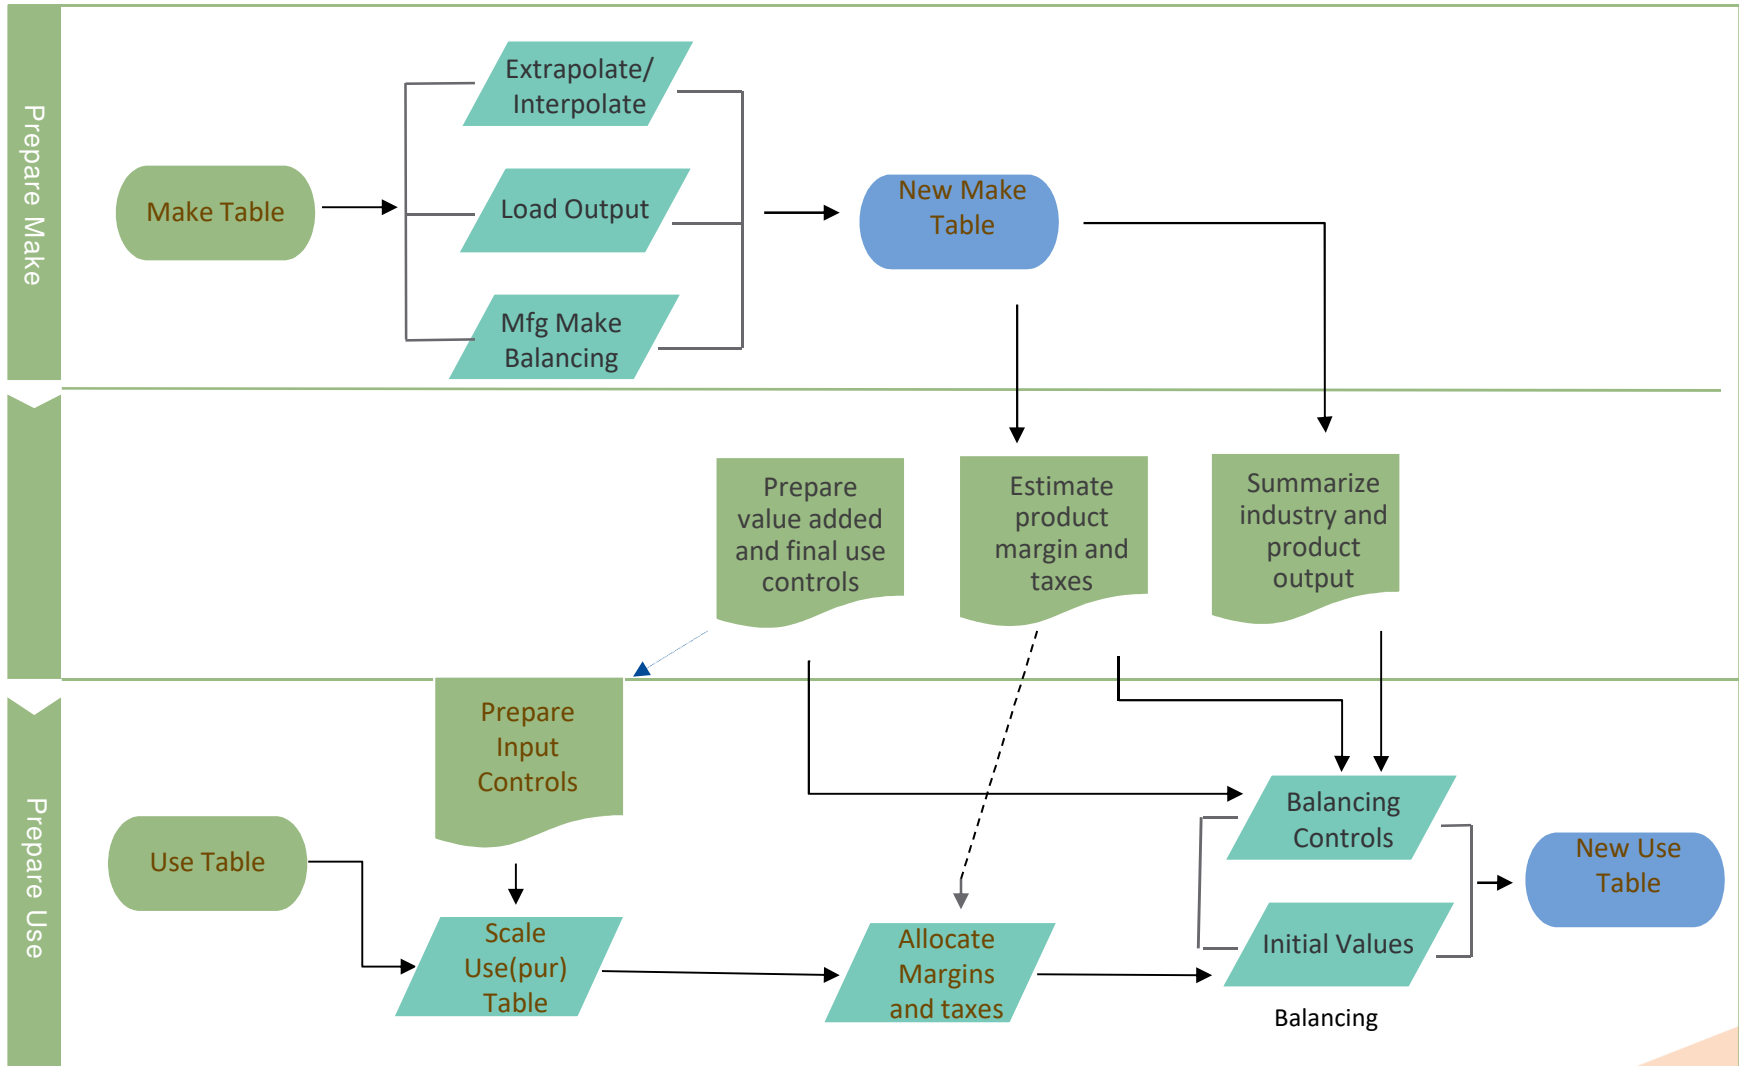

Example: Allocation of margins and taxes

Valuation Concepts

Production Flow: Annual Tables

Example: Balancing Controls

		Industries		Final Demand	control
Commodities	Margin	108	107	50	
		50	28	60	
		11	16	5	
	Basic	992	903	500	2,400
		462	282	600	1,600
		1,037	994	500	2,400
Value Added		415	1,300		1,800
control		2,390	4,500	1,800	

• Prepare balancing controls

- Total value for transportation, trade margin, and taxes drawn from the make matrix in the supply table
- Total distributed to commodities (or commodity groups) using various data sources:
 - Air and Water – Ton miles with a “handling multiplier” adjustment from the U.S. Census Commodity Flow Survey
 - Rail – Revenue by commodity group from the American Association of Railroads Freight Commodity Statistics
 - Truck – Revenue by commodity group from the U.S. Census' Survey of Annual Services
 - Pipe – Revenue by commodity from U.S. Census product line detail
 - Wholesale – Margin output available by type of wholesaler
 - Retail – Data on nominal sales by product line available from the U.S. Census Bureau Economic Census

- Iterative process where values are altered to match sets of constraints
- Multi-dimensional (not simply row/column)
- Allows for two ways of meeting constraints
 - Proportional Scaling
 - Distributive Scaling

Example: Balancing

		Industries		Final Demand	sum	control
		Commodities	Margin	86	130	54
49	50			81		
13	20			8	20	40
Basic	763		1,152	484	2,400	2,400
	438		444	717	1,600	1,600
	750		1,194	456	2,400	2,400
Value Added		200	1,500		1,800	1,800
sum		2,300	4,800	1,800		
control		2,390	4,500	1,800		

- Balance using modified RAS balancing technique
 - Scale to industry/final demand controls using standard scaling
 - Scale to value added and basic value commodity controls using standard scaling
 - Scale to margin controls using proportional allocation based on underlying basic value matrix
 - Underlying assumption: All purchasers of a product pay the same margin rates and markups
 - Repeat until table is fully balanced

Redefinitions

	Industry X Primary	Industry X Secondary
Input A	100	2
Input B	50	3
Input C	30	4
Value Added	100	2
OUTPUT	280	11

Changes are mostly cosmetic. The framework outlined above already converts between purchaser prices and producer prices. What remains to convert Use table to basic prices is

- Allocating import matrix
- Allocating duties matrix
- Allocating subsidies matrix

Estimating Supply-Use Tables

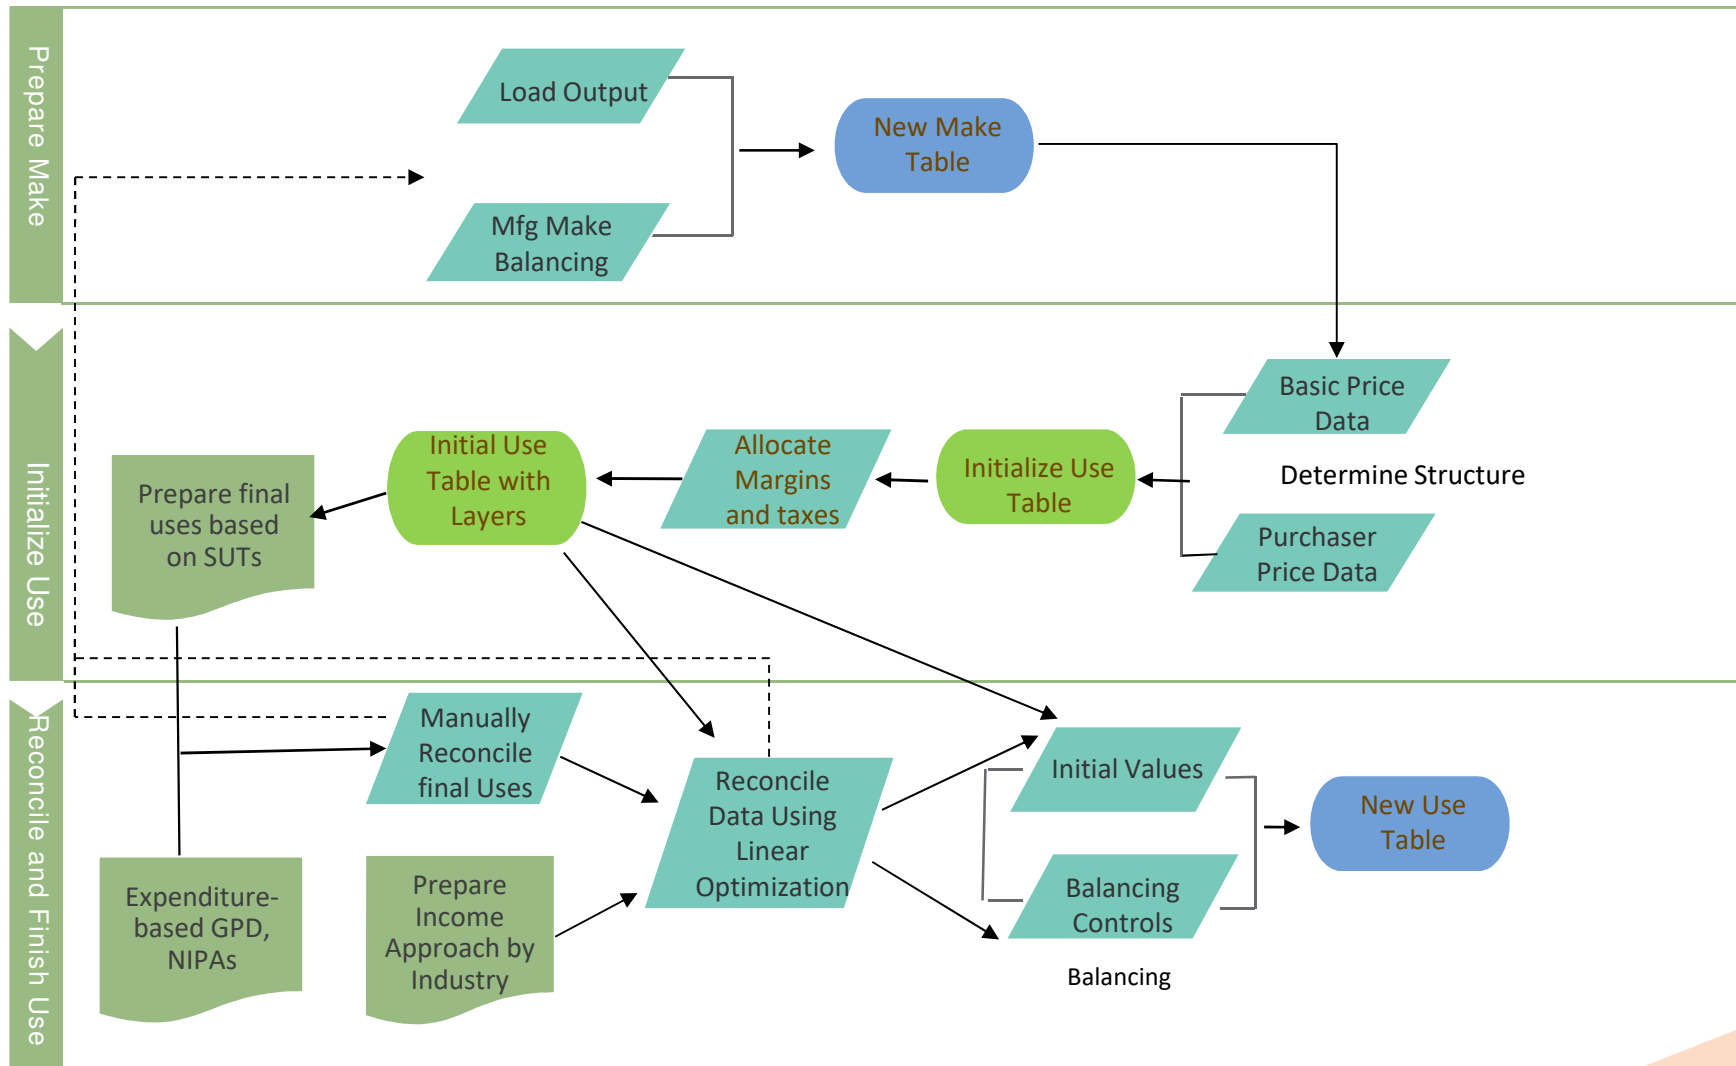

Producer Price Matrix
