

<p>Chapter 4. Units of Measurement and Conversion factors</p>	<p>SHOULD THERE BE A SECTION DESCRIBING HOW TO CALCULATE AVERAGE (SPECIFIC) CALORIFIC VALUES?</p>	<p>Yes to ensure uniformity</p>
	<p>4.69. The units to be recommended for data collection [CAN THIS BE RECOMMENDED?] for each class of fuels are as displayed on Table 16. Where there is no mention, it applies to primary as well as derived fuels.</p>	<p>It can not be recommended, because units of data collection may have to depend on local practices. It would be more convenient and accurate to use those units, which are best understood by data collectors and data suppliers.</p>
