Refugee Data Finder

Key Indicators   Data Finder   Methodology   Data Insights

People that UNHCR protects and/or assists include those who have been forcibly displaced (refugees, asylum-seekers, other people in need of international protection and internally displaced people); those who are stateless (most of whom are not forcibly displaced); and other groups of concern to whom UNHCR has extended its protection or provided assistance on a humanitarian basis. Refugee and IDP returnees are included in the solutions datasets. *The data for the latest year (2024) is available up until the mid-year, except IDMC data on Internally Displaced People which is available until end-2023.

Prevalence of stunting among children under 5 years of age

Definition
Prevalence of stunting (height-for-age <-2 standard deviation from the median of the World Health Organization (WHO) Child Growth Standards) among children under 5 years of age.

Aliases
Stunting prevalence in children 6-59 months
Prevalence of low height-for-age in children under five years of age

Associated frameworks
- Sustainable Development Goals - Indicator 2.2.1
- World Health Assembly Global Nutrition Framework - Target 1

Concepts
Child growth is an internationally accepted outcome reflecting child nutritional status. Child stunting refers to a child who is too short for his or her age and is the result of chronic or recurrent malnutrition.

Prevalence (or % or proportion) is computed using the following formula:

$$\text{Prevalence (\%)} = \frac{\text{\# of children under 5 years of age who are stunted}}{\text{\# of children under 5 years of age}}$$

Footnotes
Age ranges are presented as completed months, i. e., under 5 years is 0–4.999 months, 0–59 months is 0–59.999 months etc.
