THIRD UNITED NATIONS CONFERENCE ON THE
STANDARDIZATION OF GEOGRAPHICAL NAMES
Athens, 17 August-7 September 1977
Item 11 of the provisional agenda.
Automated data processing (ADP)

A PROGRAMME BY THE UNITED STATES OF AMERICA FOR THE AUTOMATIC
MANAGEMENT OF INFORMATION ON GEOGRAPHICAL NAMES*

Paper presented by the United States of America

* Prepared by Donald J. Orth, Jr., United States Geological Survey,
June 1977.

The success of a National program to standardize geographic names depends a great deal on effective management of name information. Large numbers of interrelated data involving (1) choice of official names, (2) their official written forms, and (3) their applications to specific features, places, or areas must be collected, processed, stored, retrieved when needed, and disseminated to a great variety of users. One method of managing this kind of information is by use of a system developed around automatic data processing. The importance of automatic data processing to National name standardization was recognized at previous United Nations Conferences. It may be useful at this time to give an outline of the computer based Geographic Names Information System (GNIS) developed by the U.S. Geological Survey (USGS) in cooperation with the U.S. Board on Geographic Names, for the management of domestic geographic names.

The geographic names office in the Topographic Division of the U.S. Geological Survey, located at the USGS National Center, Reston, Virginia, (near Washington, D.C.), is a research, coordinating, and

/...

information center. It provides a single location in the United States to which all problems and inquiries concerning domestic geographic names may be directed. The office assists the mapping and other publication programs of the Geological Survey and those of other Federal and State agencies by providing assistance and information on official standard names. It furnishes staff assistance and the Executive Secretary for the domestic names activities of the U.S. Board on Geographic Names, manages a data repository, answers public inquiries, compiles name information, publishes books and lists on domestic names, and coordinates standard name usage between the Federal and State Governments.

The Geographic Names Information System is designed to be used by all levels of Federal, State, and local governments; industry; educational institutions; and the general public. When completed, the files in the System will furnish basic and standard information about all known geographic names used within the United States. It will:

- 1) provide an up-to-date index of names found on Federal, State, and private maps,
- 2) assist in establishing uniform name usage throughout the Federal Government in cooperation with State and local governments and the public,
- 3) eliminate duplication and the need to spend large amounts of money and time by government agencies, industry, and institutions to organize similar basic data files for special requirements,

/...

- 4) provide for standardization of data elements and their coded representations for use in information interchange within the information processing community,
- 5) meet Federal public information requirements prescribed by law.

The System provides information to two kinds of users: 1) those that use the information as formatted for reference purposes, and 2) those that use the file as a subset or information base for a specialized file. The user community for geographic names information is varied and large.

The Geographic Names Information System lists primary or basic data for various kinds of features identified by a name. These include all known natural features (about 80% of the file) and most major man-related features (about 20% of the file). The man-related features include:

- 1) populated and nonpopulated places,
- 2) major and minor civil divisions,
- 3) dams and reservoirs,
- 4) National and State Parks,
- 5) military installations,
- 6) airports, and
- 7) land reservations.

The kinds of man-related features can be further identified as incorporated, rural, and seasonal.

/...

The data elements and format associated with each name record include:

- 1) Name This is the choice of name, its spelling and form recognized as official by the U.S. Board on Geographic Names.
- 2) Designator A standard term and code to identify the kind of feature to which the name applies.
- 3) BGN Date of BGN decision if applicable.
- 4) Location State and County in which the named feature is located.
- 5) Geo-Coords The accurate location and extent or limits of the named feature is provided by geographical coordinates.
- 6) Variant Other known names for a record-name feature.

While these are the minimum data associated with each record, many records will include additional information.

The collection, maintenance, and retrieval of information are now accomplished through use of an information processing program called GIPSY (General Information Processing System), developed by the University of Oklahoma, and housed in the Geological Survey's IBM System 370/155 computers. GIPSY can assemble and process large data collections composed of numerical, codified, or natural-language information. Variable length records are accommodated, and data elements can be readily updated or new information added. The system does not establish preconceived relationships between data collected and stored and allows users with no programming experience to easily

/...

access the file through cataloged routines. Any data element or set of elements can be searched and retrieved individually.

Standard procedures for building a computer-based geographic-names file have been developed by the Geological Survey. Initial compilation consists of systematic collection of name data from maps and charts published by the Geological Survey and the National Ocean Survey. These maps and charts, which follow BGN standards for names, offer the most uniform coverage available at scales large enough to permit symbolization and naming of relatively small features. These maps and charts are a valuable time-saving source of name information, and because they show natural and manmade features in accurate location, including their size, shape, and extent, it is possible visually to relate a name with the feature it identifies. Reliable quantitative and qualitative information about the named features also can be compiled with a minimum of effort.

Development of the domestic names file is at an early stage and may not be completed for several years. At present all 12,000 names of the Commonwealth of Massachusetts, 30,000 names of the State of Alaska, and 1,800 names of the State of Rhode Island have been collected, along with attendant data, and have been put in machine-readable form. The automation of about 50,000 names of the States of Colorado, Kansas, and Delaware along with about 50,000 domestic names decisions of the Board on Geographic Names probably will be completed before the end of 1977.

The authority and validity of the file as a National Standard is accomplished by:

- 1) following the decisions and procedures prescribed by the U.S. Board on Geographic Names for identifying official standard names, and by
- 2) using organically established names verified as official by the organization responsible for such features.

Information may be made available to users in three ways:

- 1) direct access to computer file by "outside" terminal
- 2) "open file" products
 - a. magnetic tape
 - b. punch cards
 - c. computer printout
 - d. microfiche
- 3) published book format
 - a. gazetteers
 - b. cumulative lists
 - c. topical lists

Attachments 1-7 show different formats in which geographic names information can be presented. With the names data for several states now in file, there is a capability to publish state gazetteers containing information according to one or more formats. The U.S. Board on Geographic Names is looking into ways to promote the publication of state gazetteers on a regular basis. At present, geographic names information can be acquired at nominal cost by users on a case-by-case basis.

The agent for data-collection monitoring and maintenance of the Geographic Names Information System files is the geographic names office in the Geological Survey, which can keep the file current and guarantee the accuracy and official status of the name data in the file without bias.

Additions to the System will be monitored by the geographic names staff. Changes of file information relating to a name or its application are processed through the Board on Geographic Names as prescribed by law or by the controlling agencies for other data. Specific information about the Geographic Names Information System can be obtained by writing to the Director, U.S. Geological Survey, National Center, Reston, Virginia 22092, U.S.A.
