All emission estimates are expressed in thousand metric tons of carbon. To convert these estimates to units of carbon dioxide (CO2), simply multiply these estimates by 3.667.

Per capita emission estimates are expressed in metric tons of carbon. Population estimates were not available to permit calculations of national per capita estimates before 1950. Bunkers refers to fuels used for international trade and are not included in national totals.

REPUBLIC OF CAMEROON

Year	Total Fossil-Fuel Emissions	Emissions from Gas Fuels	Emissions from Liquid Fuels	Emissions from Solid Fuels	Emissions from Gas Flaring	Emissions from Cement Production	Per Capita Emission Rate	Emissions from Bunker Fuels

Welcome to the official United Nations site for the MDG Indicators

Welcome to the Millennium Development Goals Indicators website. This site presents the official data, definitions, methodologies and sources for more than 60 indicators to measure progress towards the Millennium Development Goals. The data and analyses are the product of the work of the [Inter-agency and Expert Group \(IAEG\) on MDG Indicators](#), coordinated by the United Nations Statistics Division and the official progress reports and documents produced by IAEG. Links to related sites and documents and constantly updated news will keep you up to date on MDG monitoring.

Data Search:

Important note: Some of the MDG data presented in this website have been adjusted by the responsible specialized agencies to ensure international comparability, in compliance with their shared mandate to assess progress towards the MDGs at the regional and global levels.

Place II – Population, landscape, and climate estimates

Project Highlights

Version two of the Population, Landscape, and Climate Estimates data set, PLACE II, has been released as part of SEDAC's National Aggregates of Geospatial Data Collection. The aim is to provide country-level measures of spatial characteristics of 228 nations to researchers for whom national aggregates are more useful than GIS data. PLACE II estimates the number of people (head counts and percentages) and the land area (square kilometers and percentages) represented within each class of a number of demographic, physical, biological, and climatic variables for each country around the world, for the years 1990 and 2000. These variables include biomes, climate zones, coastal proximity zones, elevation zones, and population density zones. The full data array of nearly 300 variables, tabulated by country, is available for download in Excel spreadsheet format, together with supporting documentation. The PLACE II map collection displays examples of input variables and country dynamics via more than 40 maps at global, continental, and detailed scales.

Map Collection

The PLACE II [map collection](#) displays examples of input variables and country dynamics via more than 40 maps at global, continental and detailed scales.

Available Datasets

As in PLACE I, PLACE II data represent numerical estimates of population and land area dynamics for each of the world's nations, presented in spreadsheet format. The PLACE II data consist of geospatially calculated values of population and land area in specific zones of population density, coastal proximity, climate, elevation and biomes. For example, elevation zone classes are used to calculate the land area (sq. km.) of a country where the height above mean sea level is either <5 meters, 5-10 meters, 10-25 meters, 25-50 meters, 50-100 meters, 100-200 meters, 200-400 meters, 400-800 meters, 800-1500 meters, 1500-3000 meters, 3000-5000 meters, and >5000 meters. The same elevation classes are also used to tabulate the population values and percentages within the same country.

PLACE II adds a demographic time-series component by providing estimates of a decadal span, for the years 1990 and 2000. Graphical and spatial data examples are included via a [map collection](#) to allow a better understanding of the data themselves, the spatial patterns involved, as well as, initially, the dynamics and processes observed within each country and region. Codebooks describing each variable used are provided as are a [methodology](#) paper, provided in PDF and ASCII rich-text format.

Place Data Sets

The PLACE I and PLACE II country data are available for download as a Zip file containing the Excel datasheet and metadata record. Population and land area values and their associated codebooks are found as individual sheets or tabs within this file.

Descriptions of the methods used to develop these data sets can be found on the [methods](#) section.

POPBI5	population in the biome class of: temperate conifer forests.
POPBI6	population in the biome class of: boreal forests/taiga.
POPBI7	population in the biome class of: tropical & subtropical grasslands, savannas & shrublands.
POPBI8	population in the biome class of: temperate grasslands, savannas & shrublands.
POPBI9	population in the biome class of: flooded grasslands & savannas.
POPBI10	population in the biome class of: montane grasslands & shrublands.
POPBI11	population in the biome class of: tundra.
POPBI12	population in the biome class of: Mediterranean forests, woodlands & scrub.
POPBI13	population in the biome class of: deserts & xeric shrublands.
POPBI14	population in the biome class of: mangroves.
POPBI00	population where the biome data are missing.
PPOPBI1	percent population, in the biome class of: tropical & subtropical moist broadleaf forests.

In Excel file, look for codes and country in Worksheets “Pop1990” and “Pop2000”

Total population living within 100 km of the coast

Global Forest Resources Assessment 2010

NEWS

FRA 2010 Poster of contributors. Thank you!

Rome, 4 October 2010

FAO releases Global Forest Resources Assessment 2010. The final report of FRA 2010 was published at the start of the latest biennial meeting of the FAO' Committee on Forestry and World Forest Week, in Rome. [\[more..\]](#)

The Global Forest Resources Assessment 2010 (FRA 2010) is the most comprehensive assessment of forests and forestry to date - not only in terms of the number of countries and people involved - but also in terms of scope. It examines the current status and recent trends for about 90 variables covering the extent, condition, uses and values of forests and other wooded land, with the aim of assessing all benefits from forest resources. Information has been collated from 233 countries and territories for four points in time: 1990, 2000, 2005 and 2010. The results are presented according to the seven thematic elements of sustainable forest management. FAO worked closely with countries and specialists in the design and implementation of FRA 2010 - through regular contact, expert consultations, training for national correspondents and ten regional and subregional workshops. More than 900 contributors were involved, including 178 officially nominated national correspondents and their teams. The outcome is better data, a transparent reporting process and enhanced national capacity in developing countries for data analysis and reporting. The final report of FRA 2010 was published at the start of the latest biennial meeting of the FAO' Committee on Forestry and World Forest Week, in Rome. [\[more..\]](#)

■ About ResourceSTAT

Farmers produce food and fiber using a wide variety of farm practices and management systems that differ by commodity, region, and farm and operator characteristics. The mix of inputs, practices, and technologies used by farmers, when combined with land, labor, and water resources, affects production costs; farm income; and soil, water and air quality.

Welcome

Since 1988 the WHO Collaborating Centre for Research on the Epidemiology of Disasters (CRED) has been maintaining an Emergency Events Database EM-DAT. EM-DAT was created with the initial support of the WHO and the Belgian Government.

The main objective of the database is to serve the purposes of humanitarian action at national and international levels. It is an initiative aimed to rationalise decision making for disaster preparedness, as well as providing an objective base for vulnerability assessment and priority setting.

EM-DAT contains essential core data on the occurrence and effects of over 18,000 mass disasters in the world from 1900 to present. The database is compiled from various sources, including UN agencies, non-governmental organisations, insurance companies, research institutes and press agencies.

Step 1

The profile includes a summary of events from 1900 to 2011, as well as the top 10 disasters.

Separate profiles for natural and technological disasters exist

Please be sure to familiarize yourself with the EM-DAT methodology to ensure that your analyses of the data will not lead to inaccurate conclusions. [See [guidelines](#)]

Step 2

Cameroon Country Profile - Natural Disasters -

The information on natural disasters presented here is taken from EM-DAT: The OFDA/CRED International Disaster Database. In order for a disaster to be entered into the database at least one of the following criteria has to be fulfilled:

- 10 or more people reported killed
- 100 people reported affected
- a call for international assistance
- declaration of a state of emergency

Choose the period:

Top 10 Natural Disasters in Cameroon for the period 1900 to 2011 sorted by numbers of killed:

Disaster	Date	No Killed
Volcano	24-Aug-1986	1,746
Epidemic	26-Feb-1992	731
Epidemic	Feb-1993	513
Epidemic	Jun-1996	378
Epidemic	1991	308
Epidemic	May-2010	222
Epidemic	15-Jan-1998	126
Epidemic	25-Sep-1990	118
Epidemic	Jun-1998	113
Epidemic	15-Sep-2009	109

<http://www.fao.org/nr/water/aquastat/dbase/index.stm>

AQUASTAT main country database

AQUASTAT main country database

The AQUASTAT database provides information on water and agriculture by countries in the following main categories:

- **AQUASTAT Home**
 - **Databases**
 - **Countries, regions, river basins**
 - **Climate info tool**
 - **Water resources**
 - **Water use**
 - **Irrigation worldwide**
- Land use and population
 - Climate and water resources
 - Water use, by sector and by source
 - Irrigation and drainage development
 - Environment and health

The AQUASTAT database can be queried on-line and the query results can be downloaded in CSV format. The current database regroups data per 5-year period and shows for each variable the value for the most recent year during that period, if available. For example, if for the period 1998-2002 data are available for the year 1999 and for the year 2001, then the value for the year 2001 is shown. It should be noted however that for most variables no time series can be made available yet, due to lack of sufficient data.

▶ [AQUASTAT online database](#)

In the online database a search can be done both by country and by region. The **Regions File** shows what countries belong to what region.

If you have any suggestions regarding the data or the user interface, please send your feedback to: AQUASTAT@fao.org.

Time series on AQUASTAT variable [4313] on irrigation can be found under **FAOSTAT land resources** by choosing the item "Total area equipped for irrigation". For other time-series related to food and agriculture see **FAOSTAT home page**.

Data Quality

AQUASTAT is committed to maximizing the quality and international comparability of the data in its main country database. In order to be able to correctly interpret the information provided by countries, AQUASTAT is using questionnaires and holding workshops to clarify some of the more complex data concepts. Materials related to one of the workshops can be found **here**.

*Your access to AQUASTAT and use of any of its information or data is subject to the terms and conditions laid down in the **User Agreement**.*

Review of water resources statistics by country

AQUASTAT collects statistics on water resources and data on water resources obtained from national sources are systematically reviewed to ensure consistency in definitions and between countries sharing the same river basin. A methodology has been developed and rules have been established to compute the different elements of national water balances. The methodology is described in the article **Key Water Resources Statistics in AQUASTAT**. The calculation rules are provided in the country water balance sheets, which can be accessed through the dropdown menu below.

With the assistance of Mr. Jean Margat, expert in global water resources assessment, a comparative analysis of available country water resources data is carried out at regular intervals. On that basis, AQUASTAT compiles and updates its best estimates of the main elements of the water balance for each country.

The detailed results of the analysis are presented by country and updated whenever new information becomes available:

See the **glossary** for the definitions of the terminology used in the country water balance sheet.

These **external links** might also be useful.

This global web site presents OFFICIAL weather observations, weather forecasts and climatological information for selected cities supplied by National Meteorological & Hydrological Services (NMHSs) worldwide. The NMHSs make official weather observations in their respective countries. Links to their official weather service web sites and tourism board/organization are also provided whenever available. Weather icons are shown alongside worded forecasts in this version to facilitate visual inspection.

The media are welcome to make information presented in this web site available to the public. When doing so, credit to the respective NMHSs should be given.

By 1 Sep 2011, 131 Members supply official weather forecasts for 1453 cities. 1453 cities from 165 WMO Members also have their climatological data presented in this web site. Suggestions to enrich the contents of this web site are welcome.

Data Summary

Search GEMStat by using the drop-down menus or by clicking on the maps. Please follow these steps:

1. Select the summary data level (station or country)
2. Select a region
3. Select a country or watershed or Collaborating Focal Point
4. Select a station (required only when searching for station level data)
5. Select parameter(s)
6. Click on "View Data Summary"
7. Click on "View Graphs" (optional)
