Alerts vs. Beds Tracker

These graphics help analyze credible alerts vs. # of available beds. The variance view shows the difference between credible alerts and # of available beds over time. Negative numbers are highlighted in red; this indicates that there are not enough beds to meet the demand.

The trend tracker view shows the same metrics but as trend across the two measures. The y-axis represents the # of credible alerts. The x-axis represents the # of available beds. The red region indicates the breakpoint where # of beds does not meet the # of alerts.

Weekly Trend
- Credible by week

Quarantine Map

This map shows the quarantine locations. These locations can be analyzed over time using the weekly trend feature. Other features include bounding of quarantines and highlighting the most isolated quarantines. This isolation is calculated by looking at the bounding area of quarantines and highlighting the most isolated quarantines. This isolation is calculated by looking at the isolation area.

Isolation Analysis
- None

What is Zika?

Zika virus spreads to people primarily through the bite of an infected Aedes species mosquito (Ae. aegypti and Ae. albopictus). People can also get Zika through sex with an infected man, and the virus can also be passed from a pregnant woman to her fetus.

The most common symptoms of Zika are fever, rash, joint pain, and conjunctivitis (red eyes). The illness is usually mild with symptoms lasting for several days to a week after being bitten by an infected mosquito. People usually don’t get sick enough to go to the hospital, and they very rarely die of Zika. For this reason, many people might not realize they have been infected. However, Zika virus infection during pregnancy can cause a serious birth defect called microcephaly, as well as other severe fetal brain defects. Once a person has been infected, he or she is likely to be protected from future infections.

The Global Risks 2015 Report

The Ten Global Risks in Terms of Likelihood and Impact

Top 10 risks in terms of Impact:

1. Water crises
2. Spread of infectious diseases
3. Weapons of mass destruction
4. Interstate conflict
5. Failure of climate-change adaptation
6. Energy price shock
7. Critical information infrastructure breakdown
8. Fiscal crises
9. Unemployment or underemployment
10. Biodiversity loss and ecosystem collapse

Crop production or planted increased almost three times since 1949. But after 1980, the overall trend leveled off, just like the trend of water withdrawal for irrigation.
Thank you
