

Global Forum on Gender Statistics  
14 – 16 November 2018, Tokyo

Session 4:

**Producing disaster statistics from a  
gender perspective**

*Sharita Serrao*

*(prepared with inputs from Daniel Clarke)*

# Disaster-Related Statistics Framework (DRSF): A new statistical guideline

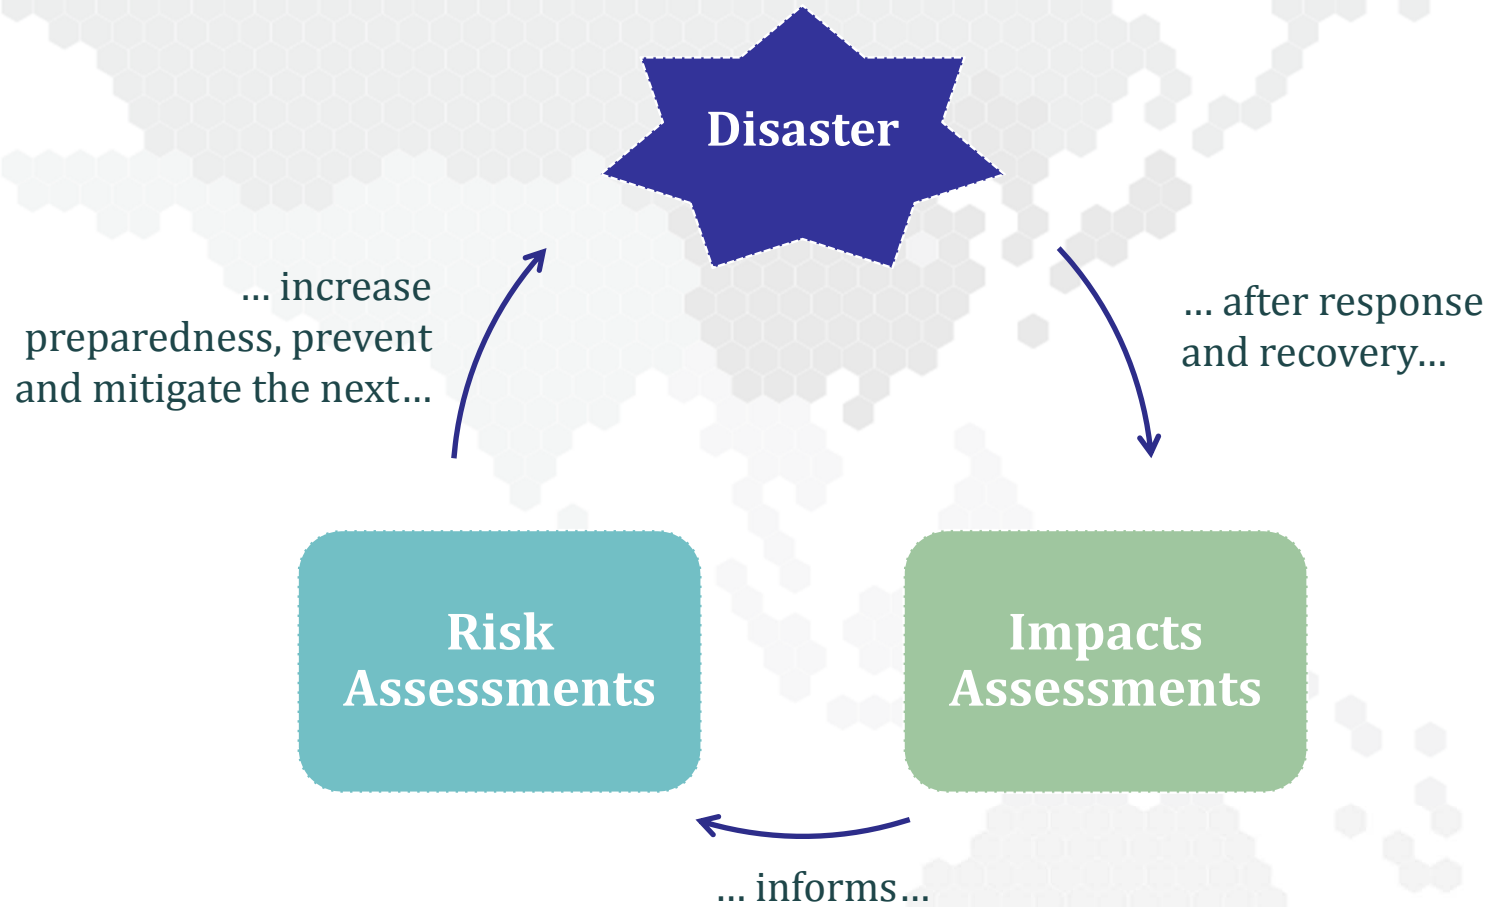

## DISASTER-RELATED STATISTICS FRAMEWORK (DRSF)

Expert Group on Disaster-related Statistics in Asia and the Pacific

- Endorsed by 6<sup>th</sup> Session of ESCAP Committee on Statistics (October, 2018)
- Developed by Expert Group of NSOs, Disaster-management agencies, and international organizations in Asia-Pacific
- Methodological foundation for technical assistance/international cooperation; aligned with:
  - Sendai Framework for DRR 2015-2030 and related indicators/terminologies for monitoring implementation;
  - Disaster-related targets of the 2030 Agenda
- Translates agreed concepts and definitions into specific instructions and technical recommendations for production and dissemination of disaster-related statistics

# Measuring risk: a critical component of disaster statistics

$$\text{Risk} = f(\text{Hazard exposure}, \text{Vulnerability}, \text{Capacity})$$

## Hazard exposure:

- Location
- Probabilistic map of hazard
- Complementary maps: population, critical infrastructure, ecosystems, crop areas, land use etc.

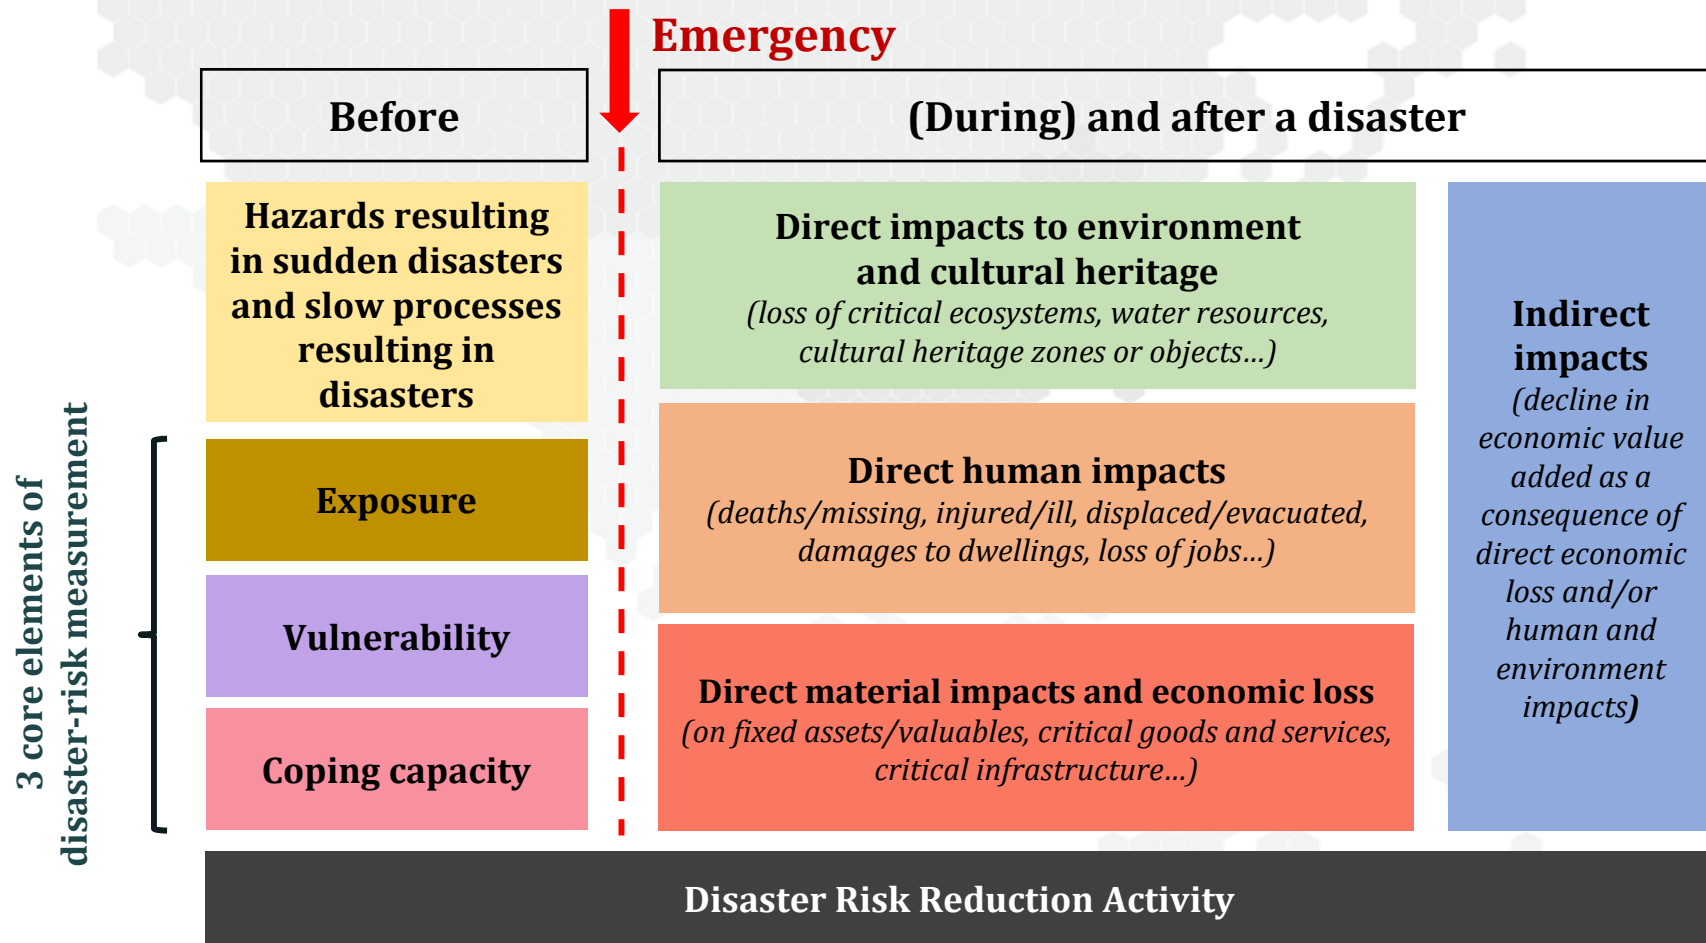

## Vulnerability:

- Extension of initial exposure statistics
- Disaggregation of population, infrastructure or lands exposed to a hazard etc.

## Coping capacity:

- Ability of individuals/households/businesses/infrastructure to recover without sustaining major/permanent negative impacts
- Ex. household preparedness, GDP per capita (proxy)

# Gender is a cross cutting element of the Disaster-Related Statistics Framework (DRSF)

Disaster-related Statistics Framework (p.22)

# Gender in the DRSF (1)

## Before

	Gender issues e.g.	Data needs/indicators e.g.	Potential sources
<b>Exposure</b>	Women/men exposure to hazards	Basic disaggregation (sex, age, location, disability status...)	<ul style="list-style-type: none"> <li>Population census</li> </ul>
<b>Vulnerability</b>	Socio-economic factors affecting vulnerability: age, disability status, income status.... access to resources, decision-making role, access to info, life skills, dependence on natural resources, exposure to VAW → can increase women's vulnerability	<ul style="list-style-type: none"> <li>Extension of initial exposure statistics with nested disaggregation</li> <li>Gender indicators: Proportion of women with a bank account; Proportion of women with access to credit; Proportion of women subjected to violence etc.</li> </ul>	<ul style="list-style-type: none"> <li>Household surveys</li> <li>Admin data (CRVS, education, health..)</li> </ul>
<b>Coping capacity</b>	Factors influencing resilience e.g. if most decisions related to disaster preparedness and recovery made by men → might omit important aspects of women's lives, needs and concerns	Ex: percentage of women involved in disaster-risk reduction activities/decision-making/public governance	<ul style="list-style-type: none"> <li>Household surveys</li> <li>Admin data (disaster management agency data , CRVS, education, health..)</li> </ul>

# Gender in the DRSF (2)

## After

	Gender issues e.g.	Data needs/indicators e.g.	Potential sources
<b>Direct impacts to the environment</b>	Impacts of disaster on ecosystems, lands, natural resources, etc. on which women might rely more heavily than men	Ex: hectares of forest tree cover, agriculture plantations, pastures and natural grassland affected by a certain type of disaster → owned/used by women & men	<ul style="list-style-type: none"> <li>• Admin data (of disaster management agency)</li> </ul>
<b>Direct human impacts</b>	Impact of disaster on women in terms of livelihood, health, survival, etc.	Ex: Number of women/men deaths/injured/missing/ill; Number of women who lost their jobs/occupation; Number of women/men evacuated/displaced	
<b>Direct material impacts and economic losses</b>	Impact of disaster on assets (small agri plots, small animals etc.) or resources (water source, fuel) on which women might rely more heavily than men	Ex: square km of agricultural land affected; number of critical water supply infrastructures destroyed	
<b>Indirect impacts</b>	Broader economic impact (women's disproportionate poverty/limited education + impact of disaster → double burden)	Macro indicators: Net impact on GDP	<ul style="list-style-type: none"> <li>• Modelled estimation from economic statistics</li> </ul>

## Risk is complex, need a simple measurement framework...

The risk measurement model:

- Provides framework to organize, analyse and make better use of disaggregated data.
- Scalable/flexible: individual to household to community.
- Applicable to risks beyond disasters, climate change and environment (e.g. health, VAW...).
