ECLAC

Time-use data collection in Latin America by NSO

Public policy

Stylized questions or diaries?

Diaries

- Argentina (2)
- Bolivia
- Brazil
- Chile
- Venezuela

No national representativity

Data were not published nor used for public policy

Stylized questions

- Argentina
- Cuba
- Chile
- Dominican Republic
- El Salvador
- Mexico
- Honduras
- Paraguay
- Uruguay
- Brazil
- Costa Rica
- Colombia
- Ecuador
- Guatemala
- Nicaragua
- Panama
- Peru

- Colombia, Ecuador, Mexico and Peru had built satellite accounts
- El Salvador, Guatemala, Costa Rica and Uruguay had valued unpaid work
- Uruguay has used the data to create and monitor their integrated national care system
- El Salvador has used the information to promote public policy on care

Set of questions, modules or independent surveys?

Stylized questions

Diaries

Set of questions

- Brazil (since 1992)
- Dominican Republic
- Ecuador
- Mexico
- Bolivia
- Colombia
- Honduras

Rich socio-demographic context variables

Design dependent on parent survey

More aggregated data

Reference period might be confusing

Time consuming

Difficulties on managing the dynamics of a diary within the parent survey

Modules

- Argentina
- Cuba
- Dominican Republic
- El Salvador
- Mexico
- Uruguay
- Brazil
- Costa Rica
- Ecuador
- Guatemala
- Nicaragua

Independent survey

- Argentina
- Chile
- Costa Rica
- Ecuador
- México
- Paraguay
- Uruguay
- Bolivia
- Colombia
- Cuba
- El Salvador
- Panama
- Peru
- Venezuela

Rich detail of activities

High cost jeopardizing periodicity

Difficult to track complete under or over reporting of times

Argentina
Bolivia
Chile
Venezuela

Why diaries have not been successful in Latin America?

Lack of statistical literacy require face-to-face interviews

Interviewers

- Require special training since time-use surveys with diaries are very different instruments than those usually used by the NSO

Left behind questionnaires were not filled or filled without providing enough context to later classify the activities.

Low response rates or increase cost of revisiting

Respondents

- Have difficulties remembering activities performed every 15 minutes
- Feel uncomfortable giving such detailed level of information (ashamed, insecurity)

Open questions are highly sensitive to the repertoire of activities that the respondent has in mind, in this sense filling the diary does not necessarily reflect what the respondent did, but what he / she remembers and believes is relevant to record.

Unreported personal activities and care-related activities

Why diaries have not been successful in Latin America?

CAPI still not widely used in the region

PAPI

- Difficulties regarding calligraphy, language, completeness
- Limit the possibly of real time data validation. Inconsistencies required revisits

CAPI

- Difficulties on internet access in some areas
- Insecurity
- Required special design and filters (software used by NSOs for surveys are usually based on questions not chronological data)

CAPI is by far the best option for diaries, since allow for filters, alerts, codification on real time, data consistency revision, etc.

However due to some difficulties to use CAPI in some regions or with particular populations, a mix of options has been used.

The use of mixed modes for capturing data (highly correlated with socio-economic characteristics of the population) could have effects on the quality of the data

Why diaries have not been successful in Latin America?

- Some population groups tend to have difficulties to manage time in intervals (children, elders, rural population) it was easier to give aggregates of time for list of activities.
- Context variables are difficult to understand/explain therefore were not always incorporated into the story of the informants, cutting the flow of the interview.
- With the use of diaries, activities that are not perceived by the respondent as relevant might not get reported while in the list the NSO assures replies for activities that are relevant for the research.
- Low response rates, revisits to households are costly (specially in rural areas).
- Heterogeneity of the population made it really hard to code activities (geographical, economical, ethnical differences impact the type of activities and also the way that activities are described)
- Unpaid domestic and care activities are usually organized on a weekly basis, not daily, therefore it is important to have representation of all days of a week. One way to do it is assign interviewers a set of households for each day , however if the household members were not reachable the day after the assigned day, the interviewer will have to return on another day making hard for the respondent to remember activities at small time intervals.
- Some advantages of time-use data collected by diaries are not being used for analysis or public policy (simultaneous activities and chronological data) *Balance of resources, quality and real use of the data!*

Are stylized questions an option for time-use data collection?

Methodological soundness

Stylized questions allow to keep a vertical interview and translate ideas important for the research into questions easily understandable by the informant.

ICATUS - CAUTAL

Cost-effectiveness

Stylized questions are easily to incorporate in modules, does not require special software or equipment and the training of interviewers is less burdensome

Respondent burden

High response rates in the region for time-use surveys using questionnaires

Relevance

Data obtained with stylized questions has allow characterization of care demands in households, is being use to shed light on gender inequalities in the region.

Accuracy and reliability

What is received as an answer both in the diary and in the questionnaire are not facts but memories or even perceptions of these facts

Timeliness and punctuality

Stylized questions does not require codification or chronological analysis saving time in that process

Stylized questions could be more accurate to measure time spend at a more disaggregated level of activities

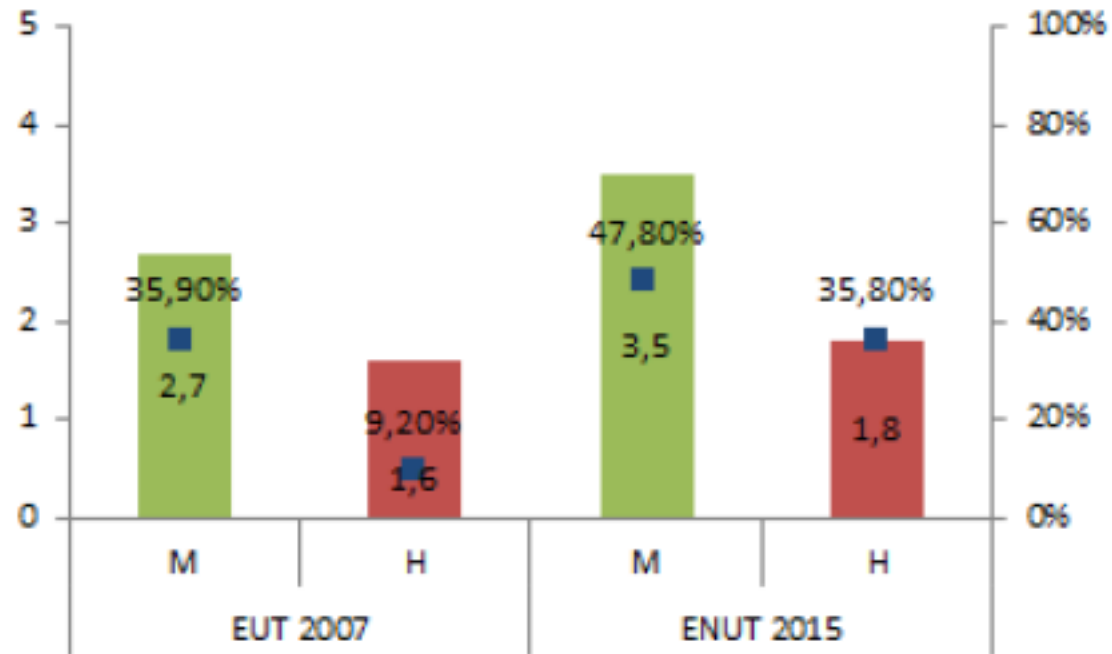

Comparative pilot studies are needed

Challenges

Imagen 1: Trabajo doméstico y de cuidados, comparación EUT 2007 y ENUT 2015

Tasa de participación (%) y tiempo promedio (en horas) de trabajo de cuidados no remunerado en un día de semana, según sexo

Tasa de participación (%) y tiempo promedio (en horas) de trabajo doméstico no remunerado en un día de semana, según sexo

Fuente: Elaboración propia en base a ENUT 2015 y EUT 2007, datos para la Región Metropolitana

Apparently the bigger effect is in terms of the estimates of participation

Country	Year	Instrument	Paid Work	Unpaid Work				Personal activities	Total
			1) Employment and related activities	2) Own-use goods production	3) Unpaid domestic work for own household	4) Unpaid care of household members	5) Unpaid work for other households or the community and volunteering	6), 7), 8), 9) Personal activities

Challenges

- The number of selected activities, the order they appear in the questionnaire, the level of aggregation have an impact in the results. **How to balance the objective of the survey without overburdening respondents?**
- Overestimates or underestimates of total time (double counting of simultaneous activities) **How to use CAPI filters to avoid this situation? How to adjust data to avoid this measurement error?**
- “Leave no one behind” **How to design instruments (including classifications relevant and pertinent to heterogeneous populations?)**
- Promote the use of time-use data for public policy
- Improve data communication and tailor messages for different audiences

Moving towards higher quality data

- Agree on a level of aggregation of activities for international comparability purposes.
- The agreed “list of activities”
 - could be the base for designing stylized questions or light diaries.
 - should allow flexibility for countries which would like to incorporate or have more granularity in the data

In Latin America time-use data has a great potential for public policy regarding the care economy, therefore measurement of care activities is crucial!
