2B. POPULATION BY AGE AND SEX

Estimates of population according to age and sex are assumed to be					
constructed on the same base data as are the total estimates. However					
certain additional factors may be involved in the case of those age					
distributions estimated from the census enumerations or from sample surveys. Please indicate below the adjustment(s) made in the basic					
age distribution used to construct estimates shown in Table PE-2 and 4.					
AD WOTHER TO IN DAOS					
ADJUSTMENTS IN BASE					
i. None - based on population actually enumerated at various ages					
or estimated from survey results			X		
ii. Enumerated population or population estimated from survey results adjusted to take account of underenumeration at					
various ages					
iii. Base age distribution "smoothed", i.e., adjusted to remove					
effects of digit preference in age reporting					
METHOD OF TIME ADJUSTMENT					
Distribution of orbital and delicated					
Distribution of estimated population according to age and sex may also be made by same methods as used to obtain the projection of the					
total figure, or it may be derived by distributing the estimate					
according to the percentage of population in each age-sex group at the					
time of the census.Please indicate below the method used in constructing the age-sex distribution of the latest estimate shown in Table PE-2.
