Table 24 - Demographic Yearbook 2003

Table 24 presents the marriages by age of groom and age of bride for as many years as possible between 1999 and 2003.

Description of variables: Marriage is defined as the act, ceremony or process by which the legal relationship of husband and wife is constituted. The legality of the union may be established by civil, religious or other means as recognized by the laws of each country.

Marriage statistics in this table, therefore, include both first marriages and remarriages after divorce, widowhood or annulment. They do not, unless otherwise noted, include resumption of marriage ties after legal separation. These statistics refer to the number of marriages performed, and not to the number of persons marrying.

Age is defined as age at last birthday, that is, the difference between the date of birth and the date of the occurrence of the event, expressed in completed solar years. The age classification generally used in this table is the following: under 15 years, 5-year age groups through 90-94, and 100 years and over. The same classification is used for both grooms and brides.

In an effort to provide interpretation of these statistics, countries or areas providing data on marriages by age of bride and groom have been requested to specify "the minimum legal age at which marriage can take place with and without parental consent". This information is presented in the table 24-1 below.

Reliability of data: Data from civil registers of marriages that are reported as incomplete (less than 90 per cent completeness) or of unknown completeness are considered unreliable and are set in *italics* rather than in roman type. Table 23 and the technical notes for that table provide more detailed information on the completeness of marriage registration. For more information about the quality of vital statistics data in general, see section 4.2 of the Technical Notes.

Limitations: Statistics on marriages by age of groom and age of bride are subject to the same qualifications as have been set forth for vital statistics in general and marriage statistics in particular as discussed in Section 4 of the Technical Notes.

The fact that marriage is a legal event, unlike birth and death that are biological events, has implications for international comparability of data. Marriage has been defined, for statistical purposes, in terms of the laws of individual countries or areas. These laws vary throughout the world. In addition, comparability is further limited because some countries or areas compile statistics only for civil marriages although religious marriages may also be legally recognized; in other countries or areas, the only available records are church registers and, therefore, the statistics may not reflect to marriages that are civil marriages only.

Because in many countries or areas marriage is a civil legal contract which, to establish its legality, must be celebrated before a civil officer, it follows that for these countries or areas registration would tend to be almost automatic at the time of, or immediately following, the marriage ceremony. This factor should be kept in mind when considering the reliability of data, described above. For this reason the practice of tabulating data by date of registration does not generally pose serious problems of comparability as it does in the case of birth and death statistics.

Because these statistics are classified according to age, they are subject to the limitations with respect to accuracy of age reporting similar to those already discussed in connection with Section 3.1.3 of the Technical Notes. It is probable that biases are less pronounced in marriage statistics, because information is obtained from the persons concerned and since marriage is a legal act, the participants are likely to give correct information. However, in some countries or areas, there appears to be a concentration of marriages at the legal minimum age for marriage and at the age at which valid marriage may be contracted without parental consent, indicating perhaps an overstatement in some cases to comply with the law.

Aside from the possibility of age misreporting, it should be noted that marriage patterns at younger ages, that is, for ages up to 24 years, are influenced to a large extent by laws regarding the minimum age for marriage

Factors that may influence age reporting, particularly at older ages include an inclination to understate the age of the bride in order that it may be equal to or less than that of the groom.

The absence of frequencies in the unknown age group does not necessarily indicate completely accurate reporting and tabulation of the age item. It is sometimes an indication that the unknowns have been eliminated by assigning ages to them before tabulation, or by proportionate distribution after tabulation.

Another age-reporting factor that must be kept in mind in using these data is the variation that may result from calculating age at marriage from year of birth rather than from day, month and year of birth. Information on this factor is given in footnotes when known.

Earlier data: Marriages by age of groom and age of bride have been shown for the latest available year in most issues of the *Demographic Yearbook*. In addition, issues, including those featuring marriage and divorce statistics, have presented data covering a period of years. For information on the specific topics and the years covered, readers should consult the Historical Index.
