Energy Balances

Leonardo Rocha Souza

Workshop on Energy Statistics for ASEAN Countries

21-23 November 2017
Kuala Lumpur, Malaysia

<http://unstats.un.org/unsd/energy>

Energy balance methodology

The energy balance is a snapshot of all flows of energy products in an area (country) in a period of time (year).

It is presented in a common unit – terajoules, for example – and with products aggregated by category: coal, oil, petroleum products, gas, biomass, etc.

Some advantages:

- It allows to compare the share of each source in the energy supply of a country and in each sector of the economic activity.
- With an energy balance it is possible to analyse the efficiency of energy industries in a country.
- Many relevant energy indicators can be drawn from an energy balance.
- It provides a very effective 'extra check' on the data

Commodity balances

- A commodity balance describes all flows of a single energy product, where supply and uses can be measured and compared.
- Products are as defined by the current energy product classification – ideally harmonized with SIEC

Commodity balances

Commodity balances (and the UNSD energy stats questionnaire) display basic energy statistics only

- Basic energy statistics comprised of combinations of products and flows

- All flows relevant to a given commodity are grouped under the commodity header

What are the limitations of basic energy statistics?

- Different reporting units and different calorific values make statistics between commodities incomparable.

Hard Coal (CL); Metric tons, thousand		2011	2012
CL01	Production	34621	35375
CL03	Imports	9184	7821
CL04	Exports	33552	34648
CL06	Stock changes	-167	-138
CLGA	Total energy supply	10420	8686
CLSD	Statistical differences	-41	-1412
CL08	Transformation	8093	7730
CL088	Transformation in electricity, CHP and heat	4391	4037
CL08811	Electricity plants - Main activity producer	4390	4036
CL08812	Electricity plants - Autoproducers	1	1
CL081	Coke ovens	3702	3693

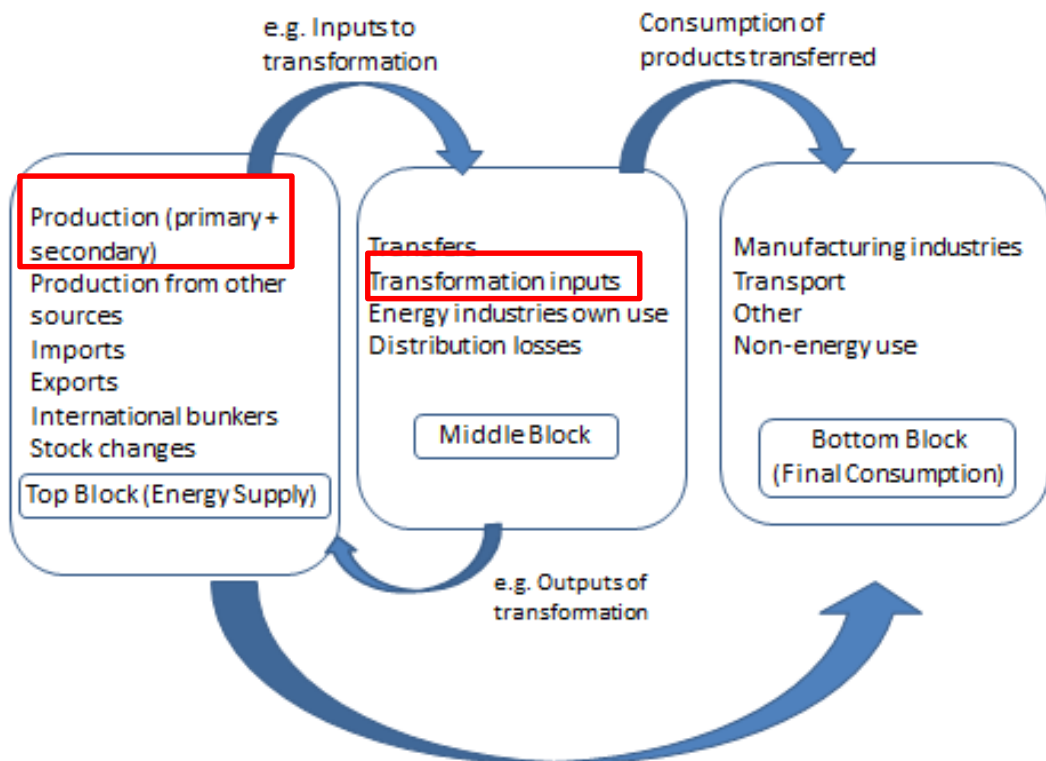

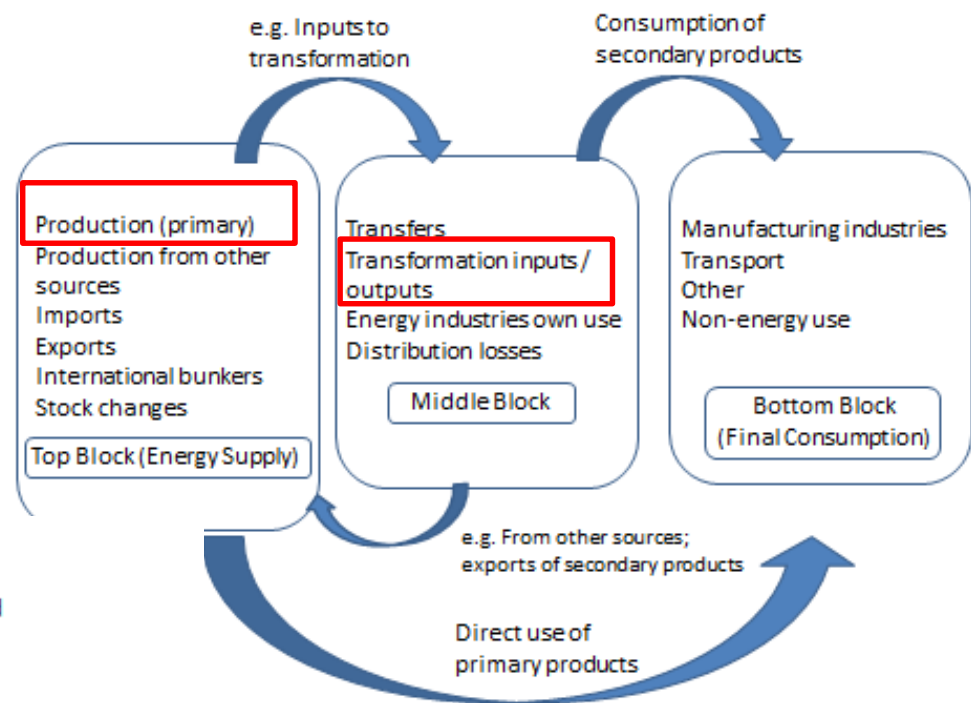

Motor Gasoline (MO); Metric tons, thousand		2011	2012
MO01	Production	28587	29584
MO03	Imports	4092	2938
MO04	Exports	5579	6086
MO06	Stock changes	-21	-96
MOGA	Total energy supply	27121	26532
MO12	Final energy consumption	30687	31676
MO122	Transport	30687	31676
MO1221	Road	30687	31676

Fuelwood (FW); Cubic metres, thousand		2011	2012
FW01	Production	31200	30094
FW03	Imports	320	384
FW04	Exports	2555	2854
FW088	Transformation in electricity, CHP and heat	8532	8531
FW08812	Electricity plants - Autoproducers	8532	8531
FW1231	Households	11334	11569

Energy Balances

- The energy balance describes all the physical flows of energy that are embodied in energy products.
- These flows are expressed in a same energy unit (e.g., terajoule, tons of oil equivalent).
- It shows all relevant commodity balances together (grouped by types of products), displaying their interrelationships.
- Flows are defined by the current energy classification (be it particular to a country or common to the members of an organization)
 - The work of InterEnerStat and the International Recommendations for Energy Statistics (IRES) constituted a huge step towards harmonization of these classifications.
- While for the country the energy balance is mostly an energy policy tool, it can also be a tool for checking data consistency, because laws of Physics should be observed in the measured energy flows.

Energy balance →

← Commodity balance

Energy balance

Conversion to energy units

- Physical units (tons or m³) are converted to energy units using Net calorific values (NCV) [kJ/kg], which ideally are measured frequently for different processes and sources and then averaged for the country/flow.
 - Specific NCV for different flows, when available (most importantly, Production and Imports)
 - Weighted-average NCV for all other flows (if only NCVs for Production and Imports are available).
 - Default NCV if no information available (undesirable case)
- If commodities are reported in energy units (such as kWh for electricity or TJ for natural gas), the appropriate conversion to a common unit must be made

Products grouped into types

Primary production only

Secondary production reported here, together with inputs to transformation (net value)

Final energy consumption with Negative: fuel burned to generate electricity Break-down into charcoal

Positive: electricity generated from hydro power Positive: Charcoal produced by small scale wood combustion Positive: Fuelwood transformed into charcoal assess indicators

Efficiency of the transformation sector

	Primary coal and peat	Coal and peat products	Primary oil	Oil products	Natural gas	Biofuels and waste	Nuclear	Electricity	Heat	Total energy	of which: renewable
2016											
Transformation	-2201	270	-1680	1640	-300	-780	-67	870	587	-1661	-124
Electricity plants	-1601				-300		-67	701		-1267	
CHP plants	-300					-780		169	587	-324	-124
Heat plants										0	
Coke ovens	-257	240								-17	
Briquetting plants	-43	40								-3	
Liquefaction plants										0	
Gas works										0	
Blast furnaces		-10								-10	
NGL plants and gas blending			-200	190						-10	
Oil refineries			-1480	1450						-30	
Other transformation										0	
Energy industries own use	-87	-31	-30		-43			-89	-124	-404	X

- Sector-wise, you can have an idea of the transformation efficiencies by type of transformation, by using an energy balance
- However, you need more detailed energy statistics to know it more precisely (and specific NCVs!)
- And maybe microdata to know individual plant efficiencies

Importance of specific NCVs - emissions

	Coal (kt)	Default NCV	Specific NCVs	Coal (TJ) default NCV	Coal (TJ) specific NCV	Default emission factor for coal (t CO2/TJ)	CO2 (tons) default NCV	CO2 (tons) specific NCV
2016								
Primary production	131.8	25.8	20.10	3400	2649			
Imports	29.0	25.8	23.20	748	673			
Exports	-12.4	25.8	28.20	-319	-349			
Stock changes	-0.5	25.8	20.10	-14	-11			
Total energy supply	147.9			3,815	2,962	94.6	360,899	280,193

- 29% higher CO₂ emission estimates by using default NCVs

Renewable energy supply (% of TES) from energy balance – top block

	country										
	Terajoules										
	Primary coal and peat	Coal and peat products	Primary oil	Oil products	Natural gas	Biofuels and waste	Nuclear	Electricity	Heat	Total energy	of which: renewable
YEAR											
Primary prod.	3400		1234		345	4567	67	234	34	9881	4835
Imports	748	158	420	1024	180	10		81		2621	10
Exports	-319	-265	-101	-873	-40	-6		-12		-1616	-6
Int'l mar. bunkers				-28						-28	
Int'l av. bunkers				-78						-78	
Stock changes	-14		170	-81						75	
TES	3815	-107	1723	-36	485	4571	67	303	34	10855	4839

In this case, the indicator would be $4839/10855 = 44.6\%$

Renewable energy supply (% of TES)

Importance on specific NCVs

	Primary coal				Biofuels and waste			Total energy	of which: renewable		
2016										default	default
										Coal NCVs	fuelwood NCVs
Primary production	3400				4567			9881	4835	25.80	9.135
Imports	748				10			2621	10	25.80	9.135
Exports	-319				-6			-1616	-6	25.80	9.135
Stock changes	-14							75		25.80	
Total energy supply	3815				4571			10855	4839		44.6%
2016										Specific NCVs	default NCVs
Primary production	2649				4567			9130	4835	20.10	9.135
Imports	673				10			2546	10	23.20	9.135
Exports	-349				-6			-1646	-6	28.20	9.135
Stock changes	-11							78		20.10	
Total energy supply	2962				4571			10002	4839		48.4%
2016										Specific NCVs	Specific NCVs
Primary production	2649				5749			10312	6017	20.10	11.50
Imports	673				13			2548	13	23.20	11.50
Exports	-349				-8			-1647	-8	28.20	11.50
Stock changes	-11							78		20.10	
Total energy supply	2962				5754			11185	6012		53.8%

Based on an assumption that the energy balance in the previous page was based on applying default NCVs from physical quantities:

- 25.8 GJ/ton for coal (other bituminous coal)
- 9.135 GJ/m³ for fuelwood (making all biomass)

Proportion of bioenergy in total renewable energy production (from balances)

country

Terajoules

	Primary coal and peat	Coal and peat products	Primary oil	Oil products	Natural gas	Biofuels and waste	Nuclear	Electricity	Heat	Total energy	of which: renewable
2016											
Primary prod.	3400		1234		345	4567	67	234	34	9881	4835
Imports	748	158	420	1024	180	10		81		2621	10
Exports	-319	-265	-101	-873	-40	-6		-12		-1616	-6
Int'l mar. bunkers				-28						-28	
Int'l av. bunkers				-78						-78	
Stock changes	-14		170	-81						75	
TES	3815	-107	1723	-36	485	4571	67	303	34	10855	4839

In this case, the indicator would be $4567/4835 = 94.5\%$

Proportion of bioenergy in total renewable energy production (specific NCVs)

	Biofuels and waste			Total energy	of which: renewable		Indicator
2016						default fuelwood NCVs	
Primary production	4567			9881	4835	9.135	94.5%
Imports	10			2621	10	9.135	
Exports	-6			-1616	-6	9.135	
Stock changes				75			
Total energy supply	4571			10855	4839		
2016						Specific NCVs	
Primary production	5749			10312	6017	11.50	95.5%
Imports	13			2548	13	11.50	
Exports	-8			-1647	-8	11.50	
Stock changes				78			
Total energy supply	5754			11185	6012		

Based on an assumption that the energy balance in the previous page was based on applying default NCVs from physical quantities:

- 9.135 GJ/m³ for fuelwood (making all biomass)
- In this case, not a big difference because the indicator was already close to 100%

United Nations Statistics Division

Thank you.
