Abstract

Write a short abstract of the statistics, and try to limit it to one page. The purpose of the abstract is to give the reader a general overview of the statistics/topic. It should therefore include a brief overview of the background and the purpose of the statistics, the population, the sample (if relevant), the main data sources, and the main users of the statistics. The abstract should also mention what is the most important contribution or issue addressed in the country practice (e.g. the practice deals with challenges of using administrative data, using of estimation, quality control, etc.). If there are other elements that are considered important, please feel free to include them in the abstract.

Keep in mind that all relevant aspects of the statistical production will be covered in more detail under the different chapters in the template. Therefore, the abstract should be short and focused on the key elements. What the most important elements are can vary from statistics to statistics, but as a help to write an abstract you can use the table below. The table can either replace a text or can be filled out in addition to writing a short text.

<table>

1. General information

1.1. Name of the statistics/topic
The statistics/topic could either be a specific energy statistics (e.g. electricity production) or a topic within energy statistics (e.g. energy balances). For more information, please see Section III of the Instructions.

Urban environment indicators on energy

1.2. History and purpose
State when the statistics were first published.

2000

Describe briefly the main purpose of producing the statistics and why it is relevant.

As known, the production and consumption of energy have a strong environmental impact. The statistics are therefore provided (by a dedicate survey) according to the DPSIR (Driver, Pressure, Impact, State, Response) framework used by the EEA (European Environment Agency). The indicators regard consumption and production of energy at city level, and the presence of adequate municipal energy policies. The annual repetition of the survey allows you to monitor the situation over time.
The survey involves the collection of environmental data in order to build urban environment indicators that feed the “Observatory on the city environment”. The issues investigated and the variables measured are those most representative of environmental concerns in urban areas. The themes are: water, air, energy, waste, noise, transport, urban green spaces and eco-management. The survey refers to 116 cities: capitals at NUTS 3 territorial level.

1.3. Reference period
State the time period the data are collected for.

Year

1.4. Frequency
Specify how often the statistics are disseminated (e.g. annually, monthly, quarterly, etc.). If the statistics are not produced at regular intervals, state at what times they have been produced in the past and the main reasons behind the irregularities.

Annually

1.5. Dissemination
Describe how the statistics are published (e.g. printed publications, online publications, online databases, etc.). If applicable, include the web address to the main website of the statistics.

online publications (http://www.istat.it/it/archivio/34473),
online databases (http://dati.istat.it/)
1.6. Regional level
State the lowest geographical level (e.g. administrative regions, municipalities, etc.) for which the statistics are made available to the public.

Municipalities

1.7. Main users
Identify the key users of the data and the main applications. Include both internal and external users, and if possible try to distinguish between end users and others.

Government and Public organizations,
Academia and research institutes,
Media

1.8. Responsible authority
Write the name of the institution and department/office with the main responsibility for disseminating the statistics (e.g.: Statistics Norway, Department of Economics, Energy and the Environment).

ISTAT (Italian Institute of Statistics), Department of Socials and the Environment

1.9. Legal basis and legally binding commitments
State the national legal basis for the data collection. Include a complete reference to the constitutional basis, and web address to an electronic version (e.g.: The Statistics Act of 16 June 1989 No. 54, §§2-2 and 2-3, http://www.ssb.no/english/about_ssb/statlaw/forskrift_en.html).

D. l. 322/1989
(http://www.governo.it/Presidenza/statistica/attivita/D.%20lgs.%20322_89.pdf)

If the data collection is not based on a legal basis, give a short description of other agreements or volunteer arrangements.

- 

If applicable, give reference to national and international commitments that are legally binding (e.g. EU statistical legal acts).

- 

1.10. Resource requirements
Specify how the production of the statistics is financed (e.g. over the ordinary budget, project based support, financial support from other institutions or organization). If applicable, state the contracting entity (e.g.: Ministry, EU Commission, OECD). A contracting entity is any entity which is ordering a survey or the compilation of a statistics, and paying for it

Over the ordinary budget

Specify the resource requirements for producing the statistics (e.g. man-labour days, number of workers involved in the statistical production process of the statistics/topic in question).

Approximately:
1.11. International reporting

List any international organizations and names of reporting schemes that the statistics are reported to. If available, also include the website where the reported data are published (e.g. International Energy Agency, Monthly Oil Statistics, UNSD, etc.).

Istat/Environment and Energy/ Urban environment indicators (http://www.istat.it/it/archivio/34473 )

2. Statistical concepts, methodology, variables and classifications

2.1. Scope

Describe the scope of the statistics (e.g. the statistics cover supply and use of all energy products in Norway, classified according to International Standard Industrial Classification of All Economic Activities – ISIC).

The indicators regard consumption and production of energy at municipal level, and the presence of adequate municipal energy policies. The annual repetition of the survey allows to monitor the situation over time. The statistics are provided according to the DPSIR framework used by the EEA.

2.2. Definitions of main concepts and variables

Describe the main concepts (e.g.: territory principle, resident principle, net calorific value, gross calorific value).

Regulatory planning instruments, photovoltaic solar panels, solar panels for water heating, district heating, energy consumptions.

Describe the main variables (e.g. how are the different energy products defined in the statistics? How are production, intermediate consumption, final consumption, transformation, feed stock, the energy sector, etc. defined?).

The main variables collected by the survey are listed below.

Approval of the Municipal Energy Plan
Annual consumption of natural gas and number of users in the city for:
  - domestic use (m³ and number of users)
  - heating (m³ and number of users)
  - other uses (m³ and number of users)
Annual consumption of electricity and number of users in the city for:
  - domestic use (MWh and number of users)
  - agricultural use (MWh and number of users)
  - industrial use (MWh and number of users)
  - tertiary sector (MWh and number of users)
District heating power station in the city:
  - annual heating production of the installation,
2.3. Measurement units

Describe in what unit the data is collected (e.g. physical unit (m3, metric tons), monetary unit (basic prices, market prices)). Describe in what unit the data is presented. Describe if the calorific values are collected (e.g. on a net vs. gross basis) and how they are used.

If applicable, describe the density of the energy product(s) and the estimated thermal efficiency coefficients of different energy products and consumer groups or by appliance. Thermal efficiency coefficient indicates the share of the energy products which is actually usable for end consumption. Descriptions of density and thermal efficiency coefficient could alternatively be put in an annex.

Physical unit (m3, kW, kWh, kWhe, kWht, MWh, number)

2.4. Classification scheme

Include references to relevant international and national standard classifications. If national, give a brief description of the standards. If available, include web addresses to the electronic version of the standards).

http://ia2dec.ew.eea.europa.eu/knowledge_base/Frameworks/doc101182
The DPSIR framework used by the EEA
To structure thinking about the interplay between the environment and socio-economic activities the European Environment Agency (EEA) uses the "DPSIR" framework, a slightly extended version of the well-known "PSR" (pressure –state –response) model used by e.g. the OECD.
DPSIR stands for: Driving forces - Pressures - State - Impact – Responses. This approach can encourage and support decision-making, by pointing to clear steps in the causal chain where the chain can be broken by policy action.
The DPSIR represents a systems analysis view: social and economic developments exert pressure on the environment and, as a consequence, the state of the environment changes. This leads to impacts on e.g. human health, ecosystems and materials that may elicit a societal response that feeds back on the driving forces, on the pressures or on the state or impacts directly, through adaptation or curative action.

2.5. Data sources

Give an overview of the different data sources used in the collection and compilation of the statistics/topic (e.g. household survey, enterprise/establishment survey, administrative data/registers, foreign trade statistics, production statistics and other primary/secondary data sources).

Examples of administrative sources/registers are: business register for enterprises and establishments, population register, land register, housing and building registers, tax registers, international trade registers, etc.

Municipality (and enterprise) survey
2.6. Population
Describe the entire group of units which is the focus of the statistics (the population).
The survey refers to 116 cities: capitals at NUTS 3 territorial level.

Specify the following statistical units:
- Reporting unit
- Observational unit
- Analytical unit

Examples of different kind of statistical units include: enterprise, enterprise group, kind-of-activity unit (KAU), local unit, establishment, homogeneous unit of production.

In most cases the reporting unit, observational unit and analytical unit are identical, but there are examples where this is not the case. In electricity statistics, you may find that energy companies (the reporting unit) provide data about different consumers like the individual household or manufacturing company (the observational unit). The analytical unit may be a group of energy consumers, defined by the ISIC.

In our case the reporting unit, observational unit and analytical unit are identical:

2.7. Sampling frame and sample characteristics
Describe the type of sampling frame used in the collection and compilation of the statistics (e.g. list, area or multiple frames). A sampling frame is the source material or device from which a sample is drawn. Note that the sampling frame might differ from the population.

For each survey(s) used for the compilation of the statistics, specify the sampling design (e.g. random, stratified, etc.). Describe the routines employed for updating the sample. Include information about the sample size, and discuss to what extent the sample covers the population (e.g. energy consumption in the sample compared to total energy use by the population).

Note that chapter 2.7: Sample frame and sample characteristics may overlap with chapter 3.4: Grossing up procedures.

2.8. Collection method
For each survey used for the compilation of the statistics/topic, describe how the data are collected (e.g. face-to-face, telephone, self-administered, paper and internet-based questionnaires, or administrative data and registers).

Internet-based questionnaires

2.9. Survey participation/response rate
For each survey used for the compilation of the statistics/topic, specify the average response rate, or refer to response rates for specific surveys conducted.

For each survey used for the compilation of the statistics, average response rate was from 96% to 100%
3. The statistical production process

3.1. Data capture and storage
Describe how the data is captured and stored (e.g. if the respondent replies using Internet-based questionnaire, the received data are electronically transferred to the production database. Paper questionnaire responses are keyed manually to the production database).

The respondent replies using Internet-based questionnaire, the received data are electronically transferred to the production database

3.2. Data editing
Describe the regular routines employed for detecting and correcting errors. This may include:
- Manual routines for detecting and correcting errors
- Automatic error-detection (and correction)
- Micro- and macro editing procedures
- Data validation procedures
- Outlier identification
- Processes and sources used for quality controls

3.3. Imputation
Describe the principles for imputation and the assumptions that these principles are based on. Note that this chapter may overlap with chapter 3.2: Data editing and chapter 5.2: Accuracy

Not really applicable. Missing and outlier data are recovered by a new interview

3.4. Grossing up procedures
Describe how the population is divided into strata and what statistical models the estimations in the strata are based on. Describe how sub-indices are combined into aggregate indices and how uncertainty is estimated.

No

3.5. Analytical methods
Give a description of any analytical methods used to adjust the data (e.g.: seasonal adjustment and temperature adjustment). A more detailed description of the analytical method can also be included as an annex.

No
4. Dissemination

4.1. Publications and additional documentation

Describe the form of dissemination of the statistics/topics in question (e.g. printed publications, website, etc.). Please provide relevant website link(s) if available.

Website (http://www.istat.it/it/archivio/34473)

Give a complete reference to publicly available statistics databases where data from the statistics can be extracted. Include web addresses if available online.

Istat online databases (http://dati.istat.it/)

Indicate whether you charge users for access to the statistics at any level of aggregation.

No

4.2. Revisions

Describe the current revision policies. E.g.: Is historical data revised when new methodology, new definitions, new classifications etc. are taken into use? Is the data continuously revised, or is the data revised at certain points in times (e.g. every third year, annually, etc.)?

Historical data annually revised and when new classifications are taken into use

If applicable, describe any major conceptual or methodological revisions that have been carried out for this statistic/topic in the past.

-

4.3. Microdata

Describe how microdata are stored.

Data is stored in database Oracle.

Specify if microdata are available for scientific and/or public use. If so, describe under what conditions these are made available.

Microdata are available for scientific and/or public use (academia and public research institutions) following procedures to get access to restricted information that transfer the liability of data confidentiality

4.4. Confidentiality

Describe the legal authority that regulates confidentiality, and what restrictions are applied to the publication of the statistics.

- The legal authority that regulates confidentiality is the ”Guarantor of the privacy”

Restrictions (to be applied) are in:
- D. l. 196/2003 ”Code for the Protection of Personal Data”.

Describe the criteria used to suppress sensitive data in statistical tables (cell suppression).
No sensitive data

Describe how confidential data are handled.

Describe any confidentiality standards that go beyond what is legally required.

- 

5. **Quality**

5.1. **Relevance**

State to which degree the statistical information meet the real needs of clients/users.

| High degree |

5.2. **Accuracy**

State the closeness of computations or estimates to the exact or true values that the statistics were intended to measure.

| High but data is not evaluated |

**Measurement and processing errors**

Discuss the measurement and processing errors that are relevant for the statistics. Try as far as possible to give an estimation of the size and scope of the errors.

| Not applicable |

**Non-response errors**

State the size of the unit non-response and the item non-response, distributed by important variables in the population (e.g. region, industry). Consider if the non-response errors are systematic, and if so, describe the methods used to correct it. Indicate whether the effects of correcting non-response errors on the results have been analysed, and, if so, describe them.

| Not applicable |

**Sampling errors**

Discuss the size of the sampling errors. Compare the population and sample with regards to important properties (e.g. coefficient of variance).

| No sample |

**Other sources of error**

Discuss other sources of errors that might be relevant for the statistics. E.g.: Model assumption errors, coverage errors

- 

5.3. **Timeliness and punctuality**

Specify the time between the end of the reference period and publication.
If the statistics are published both as preliminary and final figures, specify the time between publication of preliminary and final figures. You should also point out whether the publication date is set according to certain rules (e.g. advance release calendar, a specific day or prior to other publications).

The time between the end of the reference period and publication is 7 months.

Point out if there have been any major discrepancies between the planned publication date and the actual publication date in recent years. If so, state the length of this discrepancy and its cause.

Never.

5.4. Accessibility

Describe how easily accessible the statistics are. In particular, is there an advance release calendar to inform the users about when and where the data will be available and how to access them?

Are metadata and other user support services easily available? Are there particular groups that don’t have access to the published statistics (e.g.: visually disadvantaged)?

Yes, is there an advance release calendar to inform the users about when and where the data will be available. Metadata are available but people visually disadvantaged don’t have access to the published statistics.

5.5. Comparability

Discuss the comparability of the statistics over time, geographical areas and other domains.

Comparability over time
Discuss comparability over time and include information about whether there have been any breaks in the time series of the statistics and why. Also describe any major changes in the statistical methodology that may have had an impact on comparability over time.

In 2007 new categories of use of methane were introduced by companies. Istat process data to avoid any breaks in the time series of the statistics.

Comparability over region
Discuss comparability over geographical areas, and include information about whether the statistics are comparable to relevant statistics published by other countries and/or international organisations.

Comparability over geographical areas is possible only between cities (capitals at NUTS 3 territorial level).

Comparability over other domains
Discuss comparability over domains, and include information about whether the statistics are comparable between different industries, different types of households etc.

No.

5.6. Coherence and consistency

Discuss the coherence/consistency between preliminary and final figures.

High between two subsequent editions of final figures, because every survey start from the final figures of the precedent report validated.
Discuss the coherence/consistency between monthly, quarterly or yearly statistics within the same subject area. Can the results of different frequencies for the same reference period be combined in a reliable manner?

Not applicable

Discuss the coherence/consistency with other related statistics (also those produced by other institutions/organisations on the same subject).

- 

6. Future plans

Are there any current or emerging issues that will need to be addressed in the future? These could include gaps in collection, timeliness issues, data quality concerns, funding risks, confidentiality concerns, simplifications to reduce respondents’ burden etc.?

- Include, also through thematic extensions, similar surveys conducted by non-statistical research in order to decrease the burden;

- Extend the unit of analysis to a representative sample of municipalities in metropolitan areas.
Annexes

Illustrations and flowcharts
Illustrations and flowcharts are useful to summarize information and to get a better overview of the statistical production process. Illustrations and flowcharts can either be places in annexes or be included under relevant paragraphs in the template.

E.g.:
- A conceptual flowchart which illustrates the flow of data in the production of the statistics.
- A flowchart which illustrates the main tasks in the production process and the dependency between them.

Time schedule
Include a time schedule for the different phases of the statistical production process. The statistical production process may be divided into the following phases. Phase 1-3 may only be relevant for when a new statistics/survey is set up.

1. Clarify needs (e.g. map users needs, identify data sources)
2. Plan and design (e.g. plan and design population, sample size, how to analyze and edit data)
3. Build (e.g. build and maintain production system, test production system)
4. Collect (e.g. Establish a frame, draw the sample, collect data)
5. Edit (e.g. identify and code micro data, edit data, imputation)
6. Analyse (e.g. quality evaluation, interpret, analyse)
7. Disseminate (e.g. publish data, user contact)

Questionnaires
Include the complete questionnaire(s)/survey form(s) used

Example of publication tables
Include an example of a typical table published for the statistics. Include web addresses if available online.

Detailed description on analytical methods
If relevant, a detailed description of analytical methods used in the statistical production (like seasonal adjustment, temperature adjustment etc.) may be described in an annex. A short description can also be included in chapter 3.5: Analytical methods or under other suitable chapters.
