United Nations New York, 2025

#### **Department of Economic and Social Affairs**

The Department of Economic and Social Affairs of the United Nations is a vital interface between global policies in the economic, social and environmental spheres and national action. The Department works in three main interlinked areas: (i) it compiles, generates and analyses a wide range of economic, social and environmental data and information on which United Nations Member States draw to review common problems and to take stock of policy options; (ii) it facilitates the negotiations of Member States in many intergovernmental bodies on joint courses of action to address ongoing or emerging global challenges; and (iii) it advises interested Governments on the ways and means of translating policy frameworks developed in United Nations conferences and summits into programmes at the country level and, through technical assistance, helps build national capacities.

#### Note

The designations employed and the presentation of the material in the present publication do not imply the expression of any opinion whatsoever on the part of the United Nations concerning the legal status of any country or of its authorities, or the delimitations of its frontiers. The term "country" as used in this report also refers, as appropriate, to territories or areas. The designations of country groups are intended solely for statistical or analytical convenience and do not necessarily express a judgement about the stage reached by a particular country, territory or area in the development process. Mention of the names of firms and commercial products does not imply endorsement by the United Nations. The symbols of United Nations documents are composed of capital letters and numbers.

#### Introduction

This publication is the eighth in a series of pocketbook compilations on energy statistics designed to highlight the availability of data on various aspects of energy production, transformation and use and its linkages to other key statistics. Energy is central to the achievement of the 2030 Agenda for Sustainable Development and the Paris Agreement on climate change, and sound energy statistics are the basis for the reliable measurement of progress, thereby assisting the formulation of policy measures to achieve international and national sustainable development goals.

The information in this publication is primarily based on the energy data collection carried out by the Energy Statistics Section of the United Nations Statistics Division (UNSD). The data are available in the 2022 editions of the Energy Statistics Yearbook, the Energy Balances and the Electricity Profiles, three annual UNSD publications that present energy data in basic indicator formats, as well as formats that show a more detailed picture of production, trade, transformation and consumption of energy products in more than 200 countries and territories.

The present publication aims to synthesize this information by highlighting key indicators and using different visualizations to show developments, dependencies and distributions in a way that standard data tables cannot convey.

More information about the data collection process, as well as the other three annual publications sourced from the same database as this pocketbook, are available at <a href="https://unstats.un.org/unsd/energystats">https://unstats.un.org/unsd/energystats</a>.

#### Acknowledgements

This publication has been compiled by the Energy Statistics Section of UNSD, which is headed by Leonardo Rocha Souza. The conceptual design of this pocketbook has been carried out by Leonardo Rocha Souza, Agnieszka Koscielniak and Costanza Giovannelli. Costanza Giovannelli took the lead in the graphic design, supported by Graham Osborn and Peng Guo, while Jessica Ying Chan contributed to the preparation of the supporting text of the pocketbook. The energy data used for the pocketbook have been collected and processed by the staff of the Energy Statistics Section.

Enquiries, comments and suggestions for improving this publication are welcome and should be addressed to: <u>energy\_stat@un.org</u>.

#### **Total energy supply**

#### 1. Total energy supply per capita, 2022

Gigajoules per capita

Source: UN Energy Statistics Database / UN Geospatial. The designations employed and the presentation of material on the maps in this publication do not imply the expression of any opinion whatsoever on the part of the Secretarial of the United Nations concerning the legal status of any country, territory, city or area or of its authorities, or concerning the delimitation of its fortholiers or boundaries. Dotted line represents approximately the Line of Control in Jammu and Kashmir agreed upon by India and Pakistan. The final status of Jammu and Kashmir has not yet been agreed upon by the parties. Final boundary between the Republic of South Sudan has not yet been determined. A dispute exists between the Governments of Agrentina and the United Kingdom of Great Britalin and Northem Iteland concerning sovereighty over the Falkand statis of Havinas).

#### FACTS AND FIGURES

World total energy supply<sup>1</sup> (TES) was 619.2 EJ in 2022, increasing by 1.7% compared to 2021. The increase affected all regions but Oceania and Europe, and was most intense in Asia (+4.0%) and Northern America (+1.7%). In China alone, TES increased 7.0 EJ (+4.7%) between 2021 and 2022.

The Asian share of TES was more than half of the world total in 2022 (52.6%) with China accounting for more than a quarter of the world TES (25.1%). While 2021 saw a brief resurgence of Europe's TES, increasing by 7.4% from 2020 to 2021, this increase seems largely the product of the recovery from the pandemic, as Europe's TES decreased by 5.2% from 2021 to 2022.

International bunkers were equal to 14.3 EJ in 2022 (corresponding to 2.3% of world TES), showing a substantial increase compared to 2021 (+10.8%) but remaining well below the levels reached before the pandemic.

Dotted line represents approximately the Line of Control in Jammu and Kashmir agreed upon by India and Pakistan. The final status of Jammu and Kashmir has not yet been agreed upon by the parties. Final boundary between the Republic of Sudan and the Republic of South Sudan has not yet been determined. Adspute exists between the Governments of Agentina and the United Kingkon of Great Britain and Northern lefand concenting sovereignity over the Fakikand Island (Mahiras).

#### FACTS AND FIGURES

World primary energy production increased to 627 EJ in 2022, a 3.5% increase compared to 2021. Since 1990, primary production increased by 74.4%, corresponding to an average compounded yearly growth of 1.8%. Oil, coal and natural gas, in this order, are the largest energy sources, together representing 82.0% of total primary energy production.

A significant share of 2022 primary energy production occurred in a handful of countries:

- Six countries produced 88.2% of all primary coal, with China alone producing more than half (51.2%) of the world's coal;

- Five countries concentrated more than half of all primary oil production (54.2%), with the United States topping oil production with 17.3% of world production;

- Four countries (United States, Russian Federation, Iran and China) produced more than half of all natural gas (52.5%). Of the major four producers, the largest increase between 2021 and 2022 was in the United States, where natural gas production rose by 1.8 EJ (+5.2%). On the other hand, the largest decrease was in Russia, where natural gas production dropped by 3.1 EJ (-11.4%).

Source: UN Energy Statistics Database / UN Geospatial. The designations employed and the presentation of material on the maps in this publication do not imply the expression of any opinion whatsoever on the part of the Secretariat of the United Nations concerning the legal status of any country, territory, ofly or area or of its authorities, or concerning the definitiation of its frontiers or boundaries. Dotted line represents approximately the Line of Control in Jammu and Kashmir agreed upon by India and Pakistan. The final status of Jammu and Kashmir has not yet been agreed upon by the parties. Final boundary between the Republic of South Sudan has not yet been determined. A dispute exists between the Governments of Argentina and the United Xingionol Great Britian and Northern Ireland concerning sovereighty over the Falkand Islands (Makimas).

#### FACTS AND FIGURES

In 2022, total electricity generation reached 29.1 PWh, a 2.5% increase from 2021. Overall, electricity from renewable sources kept increasing in 2022 at a much faster pace than thermal electricity; for example, solar grew by 26.4%, and wind grew by 13.5%, while electricity generated from thermal sources increased by 1.3% in comparison to 2021.

In the long run, electricity production increased by 143.3% between 1990 and 2022; the largest absolute growth was observed for electricity generated from coal (+6,046 TWh or +136.0%) and natural gas (+4,820 TWh or +269.4%). However, the fastest growth was recorded for electricity generated from solar, wind and other sources<sup>4</sup> (+5,702.8% or +3,507 TWh). In 2022, 70.8% of all electricity was generated from non-renewable sources (20,623 TWh), mainly from non-renewable thermal (61.4% or 17,891 TWh) and nuclear sources (9.2% or 2,682 TWh). In addition, renewable electricity accounted for 66.2% of global electricity capacity additions since 2010, growing to 3,544 GW in 2022 and reaching 41.5% of total electricity capacity.

Final boundary between the Republic of South Sudan has not yet been determined. A dispute exists between the Governments of Argentina and the United Kingtion of Oreat Britain and Northern lead concerning to vertice Halkland Islands (Makimas).

#### FACTS AND FIGURES

World total final consumption<sup>7</sup> (TFC) amounted to 426.0 EJ in 2022, an increase of 2.6% compared to 2021. The largest growth occurred in Asia (+4.5%), led by above-average growth in China (+6.0%), which contributed to nearly 60% of the region's growth in absolute terms. This is in contrast to Europe, where TFC decreased by 4.7% between 2021 and 2022 after increasing by 6.1% between 2020 and 2021, when TFC rose as part of the recovery from the pandemic.

As in years past, the two leading sectors in TFC in 2022 were industries and transport, accounting for a combined 56.9% of TFC. Industries saw the biggest growth in TFC between 2021 and 2022, with an increase of 4.8%. This was followed by the transport sector, with an increase of 4.0%, with international bunkers alone increasing by 10.8%. On the other hand, while household TFC jumped up 3.3% between 2020 and 2021, 2022 saw a decrease of 0.3% from 2021.

Final consumption of coal increased a remarkable 10.2% between 2021 and 2022 driven by the industry sector, which used the vast majority of coal in 2022 (80.1%, or 33.2 EJ). On the other hand, natural gas saw a slight decrease of 1.1% over this same period. Industries consumed the most natural gas (41.0% or 29.4 EJ), followed by households (28.5% or 20.5 EJ)<sup>8</sup>.

### 79. Renewable energy share in total final energy consumption (TFEC), 2022

No data Source: UN Energy Statistics Database / UN Geospatial. The designations employed and the presentation of material on the maps in this publication do not imply the expression of any opinion whatsoever on the part of the Secretariat of the United Nations concerning the legit status of any country, territory, city or area or of its authorities, or concerning the delimitation of its frontiers or boundaries. Dotted line represents approximately the line of Control In Jammu and Kashmir agreed upon by India and Pakistan. The final status of Jammu and Kashmir agreed upon by the parties. Final boundary between the Republic of Sudan and the Republic of South Sudan has not yet been addemmined. Adjustue exists between the Governments of Argentina and the United Kingdom of Great Bitatian ad Northern Inteland concerning gowereign/ty over the Falkkand Islands (Makimas).

#### 80. Final consumption (total and per capita) and renewable (REN) energy share in TFEC, major

countries, 2022 - Exajoules, gigajoules per capita and percentage

Country	TFC <sup>9</sup>	Country	TFC per capita	Country	% REN in TFEC
China	97.1	Iceland	349.9	Dem. Rep. Congo	94.1%
United States	66.5	Qatar	341.6	Liberia	92.0%
India	30.0	Trinidad and Tobago	316.9	Uganda	91.3%
Russian Federation	22.3	Gibraltar	243.7	Somalia	89.4%
Japan	10.9	United Arab Emirates	236.4	Central African Republic	89.0%
Brazil	10.3	Oman	225.3	Ethiopia	88.4%
Iran (Islamic Rep.)	9.3	Sint Maarten (Dutch part)	221.5	Malawi	86.7%
Others	165.3	Others	50.8	Others	17.3%
World	426.0	World	51.3	World	18.1%

(9) See notes on pages 68-73.

Percentage

#### CO<sub>2</sub> emissions from fossil fuel combustion

#### 81. CO<sub>2</sub> emissions from fossil fuel combustion per capita by country, 2022

Kilograms per capita

Source: UN Energy Statistics Database / UN Geospatial. The designations employed and the presentation of material on the maps in this publication do not imply the expression of any opinion whatsever on the part of the Secretarial of the United Nations concerning the legisl status of any country, territory, city or area or of its authorities, or concerning the delimination of its fornoliers or boundaries. Dotted line represents approximately the Line of Control in Jammu and Kashmir agreed upon by India and Pakistan. The final status of Jammu and Kashmir has not yet been agreed upon by the parties. Final boundary between the Republic of South Studin has noty term determined. Adspute exists between the Governments of Argentina and the United Kingdom of Great Brital and Northern lealand concerning severeignty over the Falkand Island Status (Halvina).

#### FACTS AND FIGURES

 $CO_2$  emissions from fossil fuel combustion reached 35.0 Gigatons worldwide in 2022, increasing 2.6% from 2021, still a sign of the recovery from the pandemic, but leveling off from the jump in emissions in the previous year (2020 to 2021) of 6.0%. Despite this overall leveling off, the increase in emissions from 2021 to 2022 was still more than three times the increase in emissions in the pre-pandemic years of 2018-2019 (+0.8%). Looking at the long-term trend,  $CO_2$  emissions from fossil fuel combustion in 2022 have increased 46.3% from just 2000 (1.74% yearly compounded growth) and are 5.7 times higher than they were in 1950 (2.46% yearly compounded growth).

China was responsible for 30.6% of 2022 emissions, while the United States accounted for 13.3%, and five countries (adding India, Russian Federation and Japan) represented 59.7% of total emissions.

Coal dominated emissions in 2022 with a share of 45.6%, followed by oil (32.3%) and natural gas (22.2%). Overall, the share of emissions due to coal has decreased by 21.6 percentage points between 1950-2022. However, the share of emissions due to coal has remained relatively stagnant since approximately 2010, ranging only from 44.1% in 2019 to 47.0% in 2011 and 2012.

Emissions reached 4,364 kg of  $CO_2$  per inhabitant in 2022, down from a peak of 4,534 kg in 2011, but still 12.5% above the per capita emissions in 2000 and 81.2% above those in 1950.

# 83. $CO_2$ emissions from fossil fuel combustion<sup>10</sup> (total, per capita and per unit of GDP PPP),

# General notes

Please note that UN energy data are subject to the Terms and Conditions available at: <a href="http://data.un.org/Host.aspx?Content=UNdataUse">http://data.un.org/Host.aspx?Content=UNdataUse</a>.

# Maps disclaimer

The designations employed and the presentation of material on the maps in this publication do not imply the expression of any opinion whatsoever on the part of the Secretariat of the United Nations concerning the legal status of any country, territory, city or area or of its authorities, or concerning the delimitation of its frontiers or boundaries. Dotted line represents approximately the Line of Control in Jammu and Kashmir agreed upon by India and Pakistan. The final status of Jammu and Kashmir has not yet been agreed upon by the parties. Final boundary between the Republic of Sudan and the Republic of South Sudan has not yet been determined. A dispute exists between the Governments of Argentina and the United Kingdom of Great Britain and Northern Ireland concerning sovereignty over the Falkland Islands (Malvinas).

Maps in this Pocketbook were created based on a worldwide geospatial dataset provided by UN Geospatial (<u>https://www.un.org/geospatial</u>).

#### Data sources

Data used in this publication derive from the Energy Statistics Database maintained by the United Nations Statistics Division (UNSD). For more information, please refer to <u>https://unstats.un.org/unsd/energystats/data</u>.

Population data used to calculate the per capita indicators come from the United Nations Population Division and are available at: <u>https://population.un.org/wpp</u>.

Gross domestic product (GDP) data used to calculate energy intensity are mostly from the World Bank (GDP, purchasing power parity (PPP), constant 2021 international \$) and are available at: <a href="https://data.worldbank.org/indicator/NY.GDP.MKTP.PP.KD">https://data.worldbank.org/indicator/NY.GDP.MKTP.PP.KD</a> (updated on 16/12/2024). For some countries - namely Cuba, the Democratic People's Republic of Korea, Eritrea, French Polynesia, New Caledonia, South Sudan, Venezuela (Bolivarian Republic of) and Yemen - GDP PPP data were not available from the World Bank and International Monetary Fund (IMF) data were used instead (World Economic Outlook, available at <a href="https://www.imf.org/en/Publications/SPROLLS/world-economic-outlook-databases">https://www.imf.org/en/Publications/SPROLLS/world-economic-outlook-databases</a>). The Comptes Harmonisés sur les Echanges et L'Economie Mondiale (CHELEM) GDP database provided GDP PPP for Other Asia (<a href="https://www.cepii.fr/CEPII/fr/bdd">https://www.cepii.fr/CEPII/fr/bdd</a> modele/bdd modele item.asp?id=17).

# Geographical notes

The assignment of countries and areas follows the United Nations publication "Standard Country or Area Codes for Statistical Use" originally published as Series M, No. 49 and now commonly referred to as the M49 standard. For more information, please refer to <u>https://unstats.un.org/unsd/methodology/m49</u>.

For a detailed description of the geographical coverage of the data, please refer to <u>https://unstats.un.org/unsd/energystats/pubs/yearbook/2022/05gn.pdf.</u>

The expression *Other countries* (*x*) is used to represent all the countries and areas that are not shown separately in a chart and indicates that x countries and areas have positive values.

# Concepts, definitions and chapter notes

All the definitions of products and flows are based on the International Recommendations for Energy Statistics (IRES) available at: <u>https://unstats.un.org/unsd/energystats/methodology/ires.</u> Particularly for products, the definitions come from the Standard International Energy Product Classification (SIEC) contained in IRES. A more concise version of these definitions can be found in the Energy Balances publication (available at: <u>https://unstats.un.org/unsd/energystats/pubs/balance</u>) under the chapter "Concepts and Definitions".

Please note that in the present publication, the product coal includes peat unless otherwise specified; data for natural gas are expressed on a net calorific value (NCV) basis (as are data for all other products); energy sources (i.e. coal, oil, natural gas, biofuels and waste, and electricity and heat) generally refer to both primary and secondary products, with the exception of the chapter on primary energy production.

Per capita data are calculated by dividing energy or other values (total energy supply, electricity generation, electricity consumption, total final consumption,  $CO_2$  emissions) by population.

# Total energy supply

Note (1), page 1 - International aviation and marine bunkers are recorded separately due to their importance, e.g. for the estimation of greenhouse gas emissions. At the world level, bunkers are classified as part of transport final consumption and *are included in the world total energy supply*; however, at the country and regional levels, bunkers are not accounted for as final consumption because they pertain to more than one country or region and are *therefore subtracted from total energy supply*.

Note (2), page 2 - *Energy intensity* is calculated by dividing total energy supply by GDP, PPP (constant 2021 international \$). It corresponds to the Sustainable Development Goals (SDG) indicator 7.3.1. Total energy supply (TES) data in this publication are derived from the United Nations Energy Statistics Database, which provides TES data for the official SDG indicator 7.3.1 for 37% of countries and areas. GDP PPP data are from the World Bank, unless otherwise indicated. Any discrepancies with the official

indicator shall be attributed to the use of different sources for TES (for the remaining 63% of countries and areas) and GDP PPP.

#### Primary energy production

Note (3), page 6 - *Energy self-sufficiency* is calculated as the ratio between primary energy production and total energy supply expressed in percentage.

The category *Other primary oil* (chart 27 and table 28) refers to additives and oxygenates, and other hydrocarbons.

The category *Waste* (chart 33 and table 34) refers to other vegetable material and residues (vegetal waste), animal waste, industrial waste and municipal waste.

The category *Other biofuels* (chart 33 and table 34) refers to biogasoline, biodiesel, biogases, bio jet kerosene, bagasse, black liquor and other liquid biofuels.

#### Electricity

Note (4), pages 19, 21 - The category *Solar, wind and other sources* refers to solar, wind, geothermal, chemical heat, tide, wave and marine, and other non-specified sources.

Note (5), pages 26, 27 - Electricity capacities from geothermal, tide, wave and marine and from other non-specified sources are not shown in tables 49 and 51. They are negligible compared to the world total (54.6 GW in 2022, around 0.6% of total as an aggregate) and are not included in chart 48.

The categories *Renewable electricity generation* (Facts and figures box, map 42, table 43 and 47, chart 46) and *Renewable electricity capacity* (Facts and figures box, tables 49, 51 and 59, chart 50 and map 58) refer to hydro, wind, solar, geothermal, tide, wave and marine, as well as renewable thermal, i.e. electricity from biofuels and renewable waste.

The category *Non-renewable electricity generation* (Facts and figures box, tables 49 and 51 and chart 50) refers to: (a) non-renewable thermal, i.e. electricity generated from all non-renewable combustible fuels: coal, oil, natural gas, and non-renewable waste; (b) nuclear; and (c) chemical heat and other non-specified sources. *Non-renewable electricity capacity* (tables 49 and 51, chart 50) refers to thermal from non-renewable fuels, nuclear and other non-specified capacities.

*Electricity capacity* is the abbreviated form for net maximum electrical capacity, which in turn is defined as the maximum active power that can be supplied continuously, with all plants running, at the point of outlet (i.e., after taking the power supplies for the station auxiliaries and allowing for the losses in those transformers considered integral to the station). For annual data, it is considered as measured at the end of the reference year.

*Utilization of electricity capacity* is calculated by dividing electricity production by electricity capacity and then by the total number of hours in a year. It shows the percentage of theoretical maximal utilization; since the capacity is measured on a net basis and the production on a gross basis, there is a small upward bias in this utilization indicator.

#### Refinery output

Note (6), page 36 - World oil energy supply includes international aviation and marine bunkers; conversely, bunkers are excluded from oil energy supply calculated for countries and regions. The different approach adopted in treating international bunkers at the world level as opposed to the country level determines a divergence between the world oil supply and the sum of the country values in table 69. For further explanations, please refer to note (1) in the subsection referring to the chapter *Total energy supply*.

Refinery output refers to the total amount of oil products produced in refineries (naphtha, aviation gasoline, motor gasoline, gasoline-type jet fuel, kerosene-type jet fuel, other kerosene, gas/diesel oil, fuel oil, refinery gas, ethane, liquified petroleum gas (LPG), white spirit and special boiling point (SBP) industrial spirits, lubricants, paraffin waxes, petroleum coke, bitumen, refinery feedstocks and other oil products not elsewhere classified).

*Refinery input* refers to the amount of oil (conventional crude oil, natural gas liquids, feedstocks, other hydrocarbons, and additives and oxygenates) that has entered the refinery process.

*Refinery capacity* is the theoretical maximum annualized capacity of crude oil refineries available for operation at the end of the reference year.

The category *Other* (chart 64 and table 65) refers to refinery gas, ethane, LPG, white spirit and SBP industrial spirits, lubricants, paraffin waxes, petroleum coke, bitumen, refinery feedstocks, and other oil products not elsewhere classified. The category *gasolines* refers to aviation gasoline, motor gasoline and gasoline-type jet fuel; the category *kerosenes* refers to kerosene-type jet fuel and other kerosene.

# Total final consumption

Note (7), page 37 - *Total final consumption* (TFC) refers to the consumption of energy products by end users, which is the last stage of energy flows captured in energy statistics. As such, TFC excludes energy products that are transformed into secondary energy products. For example, fuels used for electricity and heat generation are not accounted directly in TFC, but accounted for indirectly as final electricity and heat consumption. For coal specifically, around 66% of TES in 2022 is used as input for electricity and heat generation worldwide.

Note (8), page 37 - Total final consumption comprises both final energy consumption and non-energy use. However, the sectors responsible for non-energy use are not recorded; it is likely that the industry share of total final consumption is higher than currently indicated.

Note (9), page 42 - *World total final consumption* includes international aviation and marine bunkers; conversely, bunkers are excluded from total final consumption calculated for countries and regions. The different approach adopted in treating international bunkers at the world level as opposed to the country level determines a divergence between the world total final consumption and the sum of the country values in table 80. For further explanations, please refer to note (1) in the subsection referring to the chapter *Total energy supply*.

The category *Other* (chart 77 and table 78) refers to agriculture, forestry and fishing, commerce and public services, and other non-specified consumers. The categories *industry, transport, households* and *other* do not include non-energy use in these sectors.

Renewable energy share in total final energy consumption (map 79 and table 80) refers to renewables directly consumed as energy products, as well as final consumption of electricity and heat attributed to renewable sources, including combustible renewables. It corresponds to the SDG indicator 7.2.1. Energy consumption data in this publication are derived from the United Nations Energy Statistics Database, which provides data for the official SDG indicator 7.2.1 for 37% of countries and areas. Any discrepancies with the official indicator shall be attributed to the use of different sources for the remaining 63% of countries and areas.

# CO<sub>2</sub> emissions

This chapter, introduced in the 2024 edition of the Pocketbook for the first time, presents estimates of CO<sub>2</sub> emissions from fossil fuel combustion. The calculations have been carried out using data from the United Nations Energy Statistics Database according to the 2006 Intergovernmental Panel on Climate Change (IPCC) guidelines (https://www.ipcc-nggip.iges.or.jp/public/2006gl/) and follow the reference approach. The calculations also include the category Industrial processes and product use (IPPU). For additional context. please refer to the table notes on https://unstats.un.org/unsd/energystats/pubs/yearbook/2022/t04.pdf.

Note (10), page 44 – World  $CO_2$  emissions include international aviation and marine bunkers; conversely, bunkers are excluded from  $CO_2$  emissions calculated for countries and regions.  $CO_2$  emissions are calculated as the sum of emissions from coal, oil and natural gas, while emissions from gas flaring are not included.  $CO_2$  emissions per capita are calculated by dividing  $CO_2$  emissions by population.  $CO_2$  emissions per GDP are calculated by dividing  $CO_2$  emissions by GDP, PPP (constant 2021 international \$), which corresponds to the SDG indicator 9.4.1. Data on  $CO_2$  in this publication are derived from the United Nations Energy Statistics Database, while GDP PPP data are from the World Bank, unless otherwise indicated. Any discrepancies with the official indicator shall be attributed to the use of different sources for  $CO_2$  emissions and GDP PPP.

# Energy balances

Note (11), page 46 - Transport includes international aviation and marine bunkers in the world balance, unlike for the regional balances.

Note (12), all balances, starting from page 46 - The category *of which: renewables* follows the convention used in the Energy Balances publication and therefore includes only directly identifiable renewable energy. As a result, no part of imports and exports of heat or electricity, nor their consumption, losses or own use, is considered as renewable, which may lead to differences with values presented in other chapters.

#### Indicators

Note (13), page 60 - World TES includes international aviation and marine bunkers; conversely, bunkers are excluded from TES calculated for countries and regions. Energy use (TES) per capita is calculated by dividing TES by population. Energy intensity is calculated by dividing total energy supply by GDP, PPP (constant 2021 international \$) and corresponds to the SDG indicator 7.3.1. TES data in this publication are derived from the United Nations Energy Statistics Database, which provides TES data for the official indicator 7.3.1 for 37% of countries and areas. GDP PPP data are from the World Bank, unless otherwise indicated. Any discrepancies with the official indicator shall be attributed to the use of different sources for TES (for the remaining 63% of countries and areas) and GDP PPP. **Energy self-sufficiency** is calculated as the ratio between primary energy production and total energy supply expressed in percentage. **Renewable share in TFEC** refers to renewables directly consumed as energy products, as well as final consumption of electricity and heat attributed to renewable sources, including combustible renewables. It corresponds to the SDG indicator 7.2.1. Energy consumption data in this publication are derived from the United Nations Energy Statistics Database. which provides data for the official indicator 7.2.1 for 37% of countries and areas. Any discrepancies with the official indicator shall be attributed to the use of different sources for the remaining 63% of countries and areas. **Electricity consumption per capita** is calculated by dividing electricity consumption by population.  $CO_2$  per capita is calculated by dividing  $CO_2$  emissions by population. CO<sub>2</sub> emissions per GDP are calculated by dividing CO<sub>2</sub> emissions by GDP, PPP (constant 2021 international \$), which corresponds to the SDG indicator 9.4.1. CO<sub>2</sub> data in this publication are derived from the United Nations Energy Statistics Database, while GDP PPP data are from the World Bank, unless otherwise indicated. Any discrepancies with the official indicator shall be attributed to the use of different sources for CO2 emissions and GDP PPP.

Note (14), starting from page 60 - Energy intensity for this country is calculated using GDP PPP data from the IMF.

Note (15), page 65 – Energy intensity for this country is calculated using GDP PPP CHELEM data.

Note (16), starting from page 60 - Energy statistics for this country are partially covered by another country, therefore, indicators should be interpreted with caution. See geographical notes at <u>https://unstats.un.org/unsd/energystats/pubs/yearbook/2022/05gn.pdf</u>.

The Energy Statistics Pocketbook highlights the availability of data on various aspects of energy production, transformation and use and its linkages to other key statistics. It uses visual representations of key energy indicators to facilitate the understanding of the current state and developments in the energy sector. Energy is central to the achievement of the 2030 Agenda for Sustainable Development and the Paris Agreement on climate change, and sound energy statistics are the basis for the reliable measurement of progress, thereby assisting the formulation of policy measures to achieve international and national sustainable development goals.
