EXECUTIVE SUMMARY

This report presents the results of the modules “Housing and Household Characteristics”, “Disasters and Extreme Weather Events” and “Environment and Climate”. These last two modules were integrated for the first time in the IMC 2024 – 2nd Quarter. This publication is organized into 4 chapters:

1. Methodological Aspects;
2. Environmental Characteristics of the Accommodation, Household and Population;
3. Disasters and Extreme Weather Events;
4. Environment and Climate.

Characteristics of Accommodation, Households and Population

In 2024, 94% of the population in Cape Verde lived in accommodation surrounded by independent houses, while 81% lived near roads. The percentage of the population that had public lighting near their place of residence was 79%. It is worth noting that only 12% had green spaces around their accommodation.

In the 12 months prior to the date of this survey, 43.9% of households in Cape Verde claimed that, at some point, they had insufficient water to meet their needs.

For 89% of households connected to the public water distribution network, consumption was usually charged by reading the meter in the accommodation where they lived, while for 4% of households the amount charged was already included in the rent for the accommodation. It is important to note that 5% of households with piped water stated that they did not pay for the water they consumed. At a national level, households paid an average of \$1,563.00 per month for their water bill from the public network.

Considering households without toilets or latrine, 64.9% of these usually did their physiological needs directly in the open air, 12.3% did it at home. Of the neighbors, 12.0% used a bucket/bag/sack and threw it in the street, ditch or nature.

In 2024, 66.4% of the population in Cape Verde was served or covered by waste collection. garbage/waste via containers and 16.1% was covered by the door-to-door service provided by “garbage trucks”. It should be noted that in some areas and places both types of garbage collection services coexisted.

During the week prior to the date of this survey, 81.8% of households family members separated food scraps from other waste, 24.9% separated oils food, 3.7% separated plastics, 3.6% separated glass, 3.2% separated paper/cardboard, 2.7% separated leftover medicines, 2.1% separated electrical and electronic equipment (EEE), and 4.9% separated other types of waste.

Disasters and Extreme Weather Events

In the 12 months prior to the date of this survey, 17.1% of households were affected by dry haze, 12.2% by droughts, 2.6% by heat waves or extreme temperatures, 1.4% by floods or inundations caused by rain, 0.6% by landslides, 0.2% by strong waves or coastal flooding, 0.2% by tropical storms and 0.1% were affected by other weather events extremes.

Of the 26,963 households that were affected by the dry haze in the 12 months prior to the date of this survey, 44% were represented by a man and 56% by a woman. Regarding the place of residence, 80% of these households lived in urban areas, while 20% lived in rural areas. These households were affected in the following aspects: 88.3% had the health of their members affected, 16.8% had their working days affected, 10.8% had their access to school affected, 2.6% had their assets and equipment affected, 0.9% had access to basic services affected and 1.7% were affected in other ways. Regarding measures taken to address the negative effects of dry haze, 67.4% of households did not take any measures. On the other hand, 22.1% of households went to a health facility or bought/used masks, medicines or teas.

Of the 19,276 households that were affected by drought in the 12 months prior to the date of this survey, 49% were represented by a man and 51% by a woman. Regarding the means of residence, 49% of these households lived in the middle urban, while 51% lived in rural areas. These households were affected in following aspects: 52.4% had their assets and equipment affected, 4.2% had the their housing was affected, 3.7% had their working days affected, 3.0% had access to basic services affected, 2.9% had the health of their members affected and 6.3% were affected in other ways. Regarding measures taken to cope with the negative effects of the drought, 66.8% of households did not take any measures. On the other hand, 24.4% of the affected households spent their savings.

Of the 4,085 households that were affected by heat waves in the 12 months prior to the date of this survey, 46% had a representative

male and 54% female. Regarding the place of residence, 77% of these households lived in urban areas, while 23% lived in rural areas. These households were affected in the following ways: 35.9% had their members' health affected, 4.7% had their property and equipment affected, 3.2% had their working days affected, 1.3% had their access to school affected, 1.1% had their access to basic services affected and 1.4% were affected in other ways. Regarding measures taken to address the negative effects of heat waves, 68.7% of these households did not take any measures. On the other hand, 7.9% of the affected households reinforced the structures of their homes (roof, walls, etc.).

Environment and Climate

The environmental problem that most affected the population aged 15 or over in their neighborhoods, areas and places, was the lack of green spaces. Next comes the presence of stray animals or their excrement, with 37.6%; pests, invasive species or diseases caused by vectors (mosquitoes and others), with 32.0%; noise pollution / Noise / Noise / Vibrations with 29.5%; and accumulation of garbage in the streets, rivers, hillsides, beaches, etc., with 26.4%.

Regarding the use of disposable and/or single-use plastic bags or purses, more than half of individuals aged 15 or over (61%) stated that they always used them during the last 12 months. Only 4% of individuals have never used these bags and disposable bags. In contrast, only 20% of the population had the habit of always using cloth or other reusable bags or bags. The proportion that never used these reusable bags or sacks was 21%. In terms of reducing consumption of single-use plastic products, 26% of individuals stated that they always did this action, while 19% never did it.

In the last 12 months before this survey was carried out, 61% of the population aged 15 or over turned off the tap when brushing their teeth or soaping themselves, 53% reused the water from washing clothes, fruits, vegetables, etc. for other purposes, 32% repaired or sent repair water installations (taps, toilets, etc.) and 24% replaced the equipment that had other low water consumption equipment.

The percentage of the population aged 15 or over in Cape Verde who have heard of Climate Change was 68%. The majority of them, in this case 75.4%, considered that what defines Climate Change is the increase in air temperature. On the other hand, 42.3% of this population considered the change in the seasons as one of the best definitions. The third most identified definition for Climate Change was the increase in the number of disasters and extreme weather events, with a percentage of 40.9%.

The proportion of the population aged 15 and over who thought that the use of fossil fuels is one of the main causes of Climate Change, it was 81.0%.

The percentage who thought that deforestation was one of the causes was 55.3%. In contrast, 29.6% of individuals aged 15 or older thought that Climate Change had causes. non-human.

The vast majority of the population aged 15 and over (85%) felt concerned about Climate Change and its impacts, while 9% felt unconcerned and 6% felt indifferent. Exactly three-quarters (75%) of the population aged 15 and over considered that Climate Change threatens or will threaten the well-being of their household, while 20% did not consider it a threat and 5% felt indifferent.

The main source used by the population aged 15 or over to learn about Climate Change was Television, with 47%. Next comes the Internet/Social Networks/Applications, with a proportion of 39%, Schools/Universities with 5%, Radio with 4% and other sources of information (family, friends, communities, churches, newspapers/paper magazines, employer, etc.) also with 4%.

For 30% of the population aged 15 or over, the main person responsible for combating Climate Change is Individuals. Then Comes Organizations international with 23%, developed countries with 20%, national government with 13%, and others with 9%. It is worth mentioning that 67% of the population aged 15 or over thought that the actions taken by the government to combat the impact of Climate Change were insufficient to address the impacts on people and localities. On the other hand, 28% of people thought that the actions taken were good and sufficient.

More than three quarters of the population aged 15 or over, exactly 77%, considered that the place where they lived was hotter in the last year compared to the last 5 years. However, 11% thought the temperature did not change and 11% thought it was less hot. Only 14% of the population aged 15 or over considered that the place where they lived was rainier last year compared to the last 5 years. In contrast, 73% thought that the last year was less rainy and 12% that nothing changed in the last 5 years.

Introdução

INTRODUCTION

The Continuous Multi-Objective Survey (IMC) is a statistical operation for collecting data from households, which harmoniously integrates a set of modules, based on the labour market module. This statistical operation replaces the various surveys that were carried out independently and provides public authorities, decision-makers and other users with indicators for macroeconomic analysis, planning, formulation and evaluation of policies, etc.

The IMC carried out in the 2nd Quarter of 2024 integrated the following modules: Characteristics of the Housing and Household; Disasters and Extreme Weather Events; Features Sociodemographic; Education; Information and Communication Technologies (ICT); Market Work; Other Forms of Work; and Environment and Climate.

This report presents the results of the modules “Accommodation and Household Characteristics”, “Disasters and Extreme Weather Events” and “Environment and Climate”. These The last two modules were integrated for the first time in the IMC 2024 – 2nd Quarter, in accordance with the following objective presented in the National Strategy for the Development of Statistics (ENDE) 2022-2026: “3. Improve the Coverage and Quality of Statistical Production”. To achieve this objective, one of the activities planned in the ENDE for 2024, was the execution of the following activity: “carry out a survey on the environment and climate change among the population/families”.

Cape Verde, being a Small Island Developing State (SIDS), has a high vulnerability to Climate Change and has an urgent need to adapt to its impacts. The social, economic, political and environmental development of the country will not be achieved or will not be sustainable if Climate Change and the effects of natural disasters are not understood and taken into account. To do this, it is necessary to have reliable and quality data on them. In this context, too, it is necessary to have information statistics on the interrelationship between population and environment. Thus, the collection of statistical information on environmental awareness, habits, adoption of measures environmental issues and the perception of climate change among families is fundamental, so to have a clearer understanding of their behavior and thus contribute to the formulation of better public policies, including better environmental education and climate.

This publication is organized into 4 chapters:

1. Methodological Aspects;
2. Environmental Characteristics of the Accommodation, Household and Population;

3. Disasters and Extreme Weather Events;

4. Environment and Climate.

This report also includes an Executive Summary of the main results, Bibliographic References and Annexes.

CAPÍTULO 1

Aspetos Metodológicos

1 METHODOLOGICAL ASPECTS

1.1 OBSERVATION UNITS

The basic units of analysis are households and their members (individuals).

1.2 POPULATION SCOPE

The BMI 2024 – 2nd Quarter was carried out with a sample of 9,918 households, randomly and independently selected within each municipality. The sample has a confidence level of 90%, for a relative accuracy of 10%.

The sample, when weighted, translates into a total of 511,534 individuals distributed across 157,622 households, nationwide. For each selected accommodation, one resident household was the object of direct observation.

The module “Disasters and Extreme Weather Events” has been answered, whenever possible, by the representative of the household or by his/her spouse. In cases where these individuals did not have the capacity to respond, a qualified individual, aged 15 or over, answered the requested questions in all the necessary detail.

Specifically in relation to the “Environment and Climate” module, this was intended for one and only one member, aged 15 or over, selected from each household subject to direct observation. This individual was selected based on the Kish method.

1.3 GEOGRAPHICAL SCOPE

The geographic scope of IMC 2024 – 2nd Quarter is national and includes the 22 municipalities of the country's 9 inhabited islands.

1.4 TEMPORAL SCOPE

The collection took place at the end of the second (2nd) quarter of 2024 (April-June).

1.5 REFERENCE PERIOD

The reference periods vary according to the following sections or modules of the IMC 2024 – 2nd Quarter:

Table 1: Reference period of the IMC 2024 modules – 2nd Quarter analyzed in this report.

Variables	Reference period
Accommodation characterization	Interview time
Characterization of the household	Interview time
	Last week
	Last month
	Last 3 months
	Last 12 months preceding the interview
Disasters and Extreme Weather Events	Last 12 months preceding the interview
Characterization of the individual	Interview time
Environment and Climate	Interview time
	Last 12 months preceding the interview
	Last 5 years

1.6 COLLECTION METHOD

The information collection method used was “collection by direct interview”, which consists, as the name suggests, of direct interviews with members of the household.

The information collected was recorded directly in the electronic questionnaire on the Tablet. A data entry application was incorporated into this equipment, where

All information obtained during the collection is recorded in order to guarantee the quality of the information and speed up the calculation of results.

1.7 METHODOLOGY OF THE “CLIMATE DISASTERS AND EVENTS” MODULE EXTREMES”

The methodology chosen to develop the module “Disasters and Extreme Weather Events” was based on the document “Natural Disasters *And Climate Change Survey - Module Sourcebook*”, prepared by the Secretariat of the Pacific Community (SPC). More information about this document can be found in the “Bibliographic References” of this report. This Reference Manual

consolidates the recommendations of international frameworks, milestones and methodologies for the design and implementation of household surveys on the effects socioeconomic impacts of natural disasters and climate change. This document is presented as a reference guide for household survey managers in National Statistics Institutes (INEs), government agencies, development partners, climate experts, the private sector, citizen organizations, researchers and students. Although it was developed for the Pacific context, the manual

can be applied to all regions of SIDS, as well as to any country with an interest to improve data collection on natural disasters and climate change impacts climate change. The modules presented in this manual will help to calculate relevant international indicators for reporting to the Global Set of Climate Change Statistics and Indicators (*The Global Set, 2022*), the Framework for the Development of Environmental Statistics (FDES, 2013), the Sendai Framework (2015), the Disaster-Related Statistical Framework (DRSF, 2018) and SDG monitoring systems.

The objective of “Disasters and Extreme Climate Events” is to collect information on the socioeconomic impacts of natural disasters, of a climatological nature, at the level of households in the last 12 months. This module is designed as a small set of additional questions that can be appended to existing population or agricultural censuses and household surveys. The “Disasters and Extreme Weather Events” module provides a standardized method for monitoring natural disasters and the impact of climate change on household assets, livelihoods, productive activities, human health, access to essential services, employment, education and migration. This module is designed for both PAPI (paper-based questionnaire interview) and CAPI (computer-assisted) interviews.

1.8 MAIN CONCEPTS AND DEFINITIONS

Dry Mist

Dry haze is a dust storm from the Sahara Desert, common in various periods of the year in Cape Verde, and which usually lasts several days.

Flood

General term for the overflow of water from a canal, river, lake, stream or dam to adjacent flat land, as well as the accumulation of water at or near the point where rain fell (flash floods). A flash flood is a flood caused by heavy rainfall.

Disaster

Defined by the United Nations International Strategy for Disaster Reduction as a "serious disruption of the functioning of a community or society, involving widespread human, material, economic or environmental losses and impacts, which exceeds the ability of the affected community or society to cope using its own resources".

landslide

Any moderate to rapid ground movement, including mudslides and water flows.

debris. A landslide is the movement of soil or rock controlled by gravity, and the speed usually varies from slow to fast (but not too slow).

It can be superficial or deep, with materials forming a mass that is a part of the slope or the slope itself.

Extreme weather events

Meteorological and climatic phenomena that occur in an accentuated and unusual way.

Some examples of extreme weather events are: drought, dry haze, flood, landslide, coastal flooding, tropical storm, hurricane, heat wave, etc.

Extreme weather events are threats to traditional ways of life and can cause biodiversity losses, economic losses, water scarcity, food insecurity, proliferation of vector-borne diseases and even the loss of human lives.

Greenhouse Gases (GHG)

Gases that trap heat from the sun in the Earth's atmosphere, thus warming the planet's surface.

These gases can originate from natural phenomena or industrial processes. The former include carbon dioxide (CO₂), methane (CH₄) and

nitrous oxide (N₂O). Fluorinated gases such as hydrofluorocarbons (HFCs), sulfur hexafluoride (SF₆) and nitrogen trifluoride (NF₃) are synthetic.

Hurricane

It is a tropical cyclone that originates in tropical or subtropical waters. It is characterized by a warm-core, non-frontal cyclone with a low-pressure center, spiral rain bands, and strong winds.

Coastal flooding

Coastal flooding occurs when dry, low-lying land is submerged (flooded) by seawater. Seawater can flood land through several

different paths: direct flooding, crossing a barrier or breaking a barrier

barrier. Coastal flooding is largely a natural phenomenon. Due to

the effects of climate change (e.g. rising sea levels and increased extreme weather events) and the increase in the population living in coastal areas, the damage caused by coastal flooding has intensified and more and more people are affected.

Changes / Climate Changes

Complex phenomena caused by the increase in Greenhouse Gases (GHG) in the atmosphere and the consequent increase in the greenhouse effect. This effect is natural and essential to maintain the Earth's temperature within a range that makes it habitable, but human activities have significantly increased the concentration of GHGs. This worsening of the greenhouse effect is causing the average temperature of the atmosphere to rise, which leads to the phenomenon we call global warming. Global warming leads to changes in the main climatic variables – temperature (of the air, ocean, other bodies of water), precipitation, wind and circulation of ocean currents. The Earth's climate

is undergoing rapid changes compared to historical natural variations. This is evident through several observations, such as the increase in average temperatures global warming, rising sea levels, changes in terrestrial and aquatic ecosystems, or changes in ice cover. These changes are in turn responsible for extreme weather events such as droughts, floods, heat waves, and windstorms or hurricanes.

Heat wave

It can be considered an example of excessive extreme temperature, which consists of a significant heating of the air or an invasion of very hot air over a large area, with lasting from a few days to weeks. The temperatures reached during a heat wave are within the extreme maximum values.

Environmental problems

These are complex challenges and issues that affect the Earth and its natural systems. Some of the main environmental problems are: Pollution (of air, water, soil and noise); Climate Change; Deforestation; and Biodiversity Loss.

Dry

A prolonged period of low rainfall or unusually low rainfall that produces scarcity of water for people, animals and plants. Drought differs from most other dangers as it develops slowly, sometimes even over years, and its onset is often difficult to detect. Drought is not just a physical phenomenon, because human activities and needs can aggravate its impacts.

Storm

Disturbance of the normal state of the atmosphere, manifested by winds of unusual strength or direction, often accompanied by rain, snow, hail, thunder and lightning.

1.9 DATA PROCESSING AND ANALYSIS

Regarding data processing, the SGI (Survey Management System) application already included a program to control coherence between variables. However, the SPSS statistical program was used for processing and analyzing data coherence.

and production of the tabulation.

CAPÍTULO 2

Caraterísticas dos Alojamentos, Agregados Familiares e População

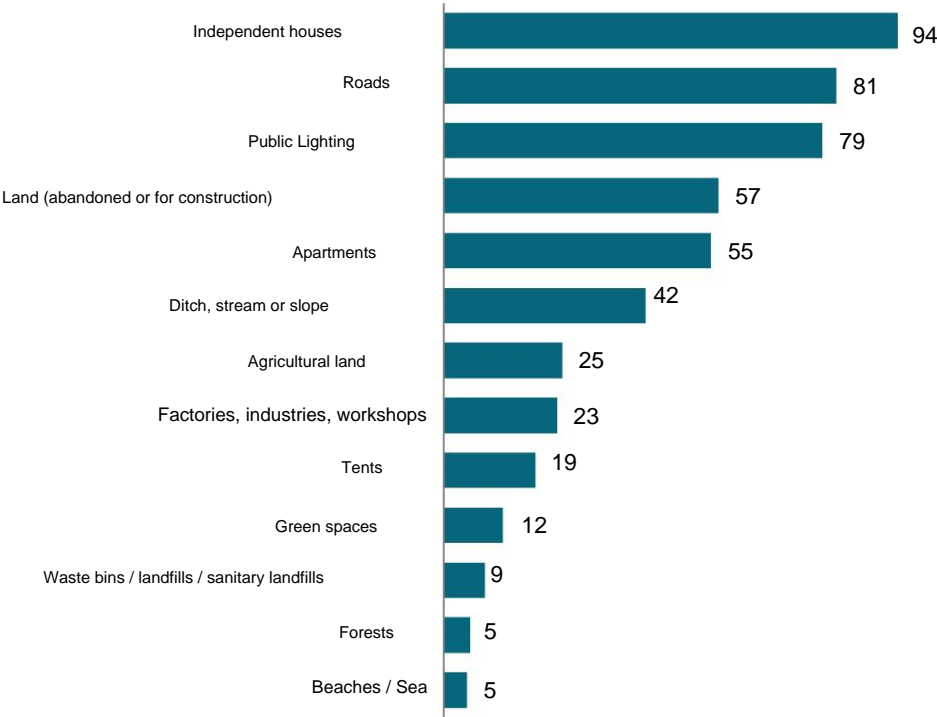

2 CHARACTERISTICS OF ACCOMMODATION, AGGREGATES
FAMILY MEMBERS AND POPULATION

This chapter will present and analyze the statistics and environmental indicators obtained from the data collected through the “Living Conditions and Household Characteristics” module.

2.1 WHAT'S AROUND THE ACCOMMODATION

In 2024, 94% of the population in Cabo Verde lived in accommodation surrounded by independent houses, while 81% lived near roads. The percentage of the population that had public lighting near where they lived was 79%. It is worth noting that 23% of the national population had factories, industries and workshops around their accommodation and only 12% had green spaces around their accommodation.

Graph 1: Percentage of the population according to some characteristics around their accommodation (%). Cape Verde, 2024

Source: INE, IMC 2024

It is worth noting that there was a greater proportion of people living near roads in urban areas (86%) than in rural areas (68%). The same situation can be seen in relation to public lighting, with the proportion in urban areas (85%) being higher than in rural areas (60%). On the other hand, in rural areas there were higher proportions of the population living near ditches, streams and slopes, agricultural land, green spaces, forests and even beaches.

Graph 2: Percentage of the population according to what is around the building where they live, by type of residence (%). Cape Verde, 2024

Source: INE, IMC 2024

The graph below shows that there was no major difference between the sexes in terms of the percentages of the population according to what they have around the accommodation where they live. It is worth noting that the only indicator with a higher percentage for women was that of people who said they had forests around their home.

Graph 3: Percentage of the population according to what is around the building where they live, by sex (%). Cape Verde, 2024

Source: INE, IMC 2024

2.2 WATER SUPPLY AND CONSUMPTION BY HOUSEHOLDS

2.2.1 General

In the 12 months prior to the date of this survey, at some point 43.9% of households in Cape Verde had insufficient amounts of water to meet their needs. This proportion was higher in rural areas (52.3%) than in urban areas (41.5%). Regarding the gender of the representatives, households represented by women had 46.6%, while those represented by men had 41.0%. The municipalities where these percentages were higher are: Maio, S. Lourenço dos Órgãos and

Santa Cruz with 75.0%, 65.8% and 65.6%, respectively. On the other hand, the municipalities with the lowest proportions of households that at some point had insufficient water were Tarrafal de S. Nicolau, S. Filipe and Ribeira Brava with 10.9%, 11.8% and 15.8%, respectively.

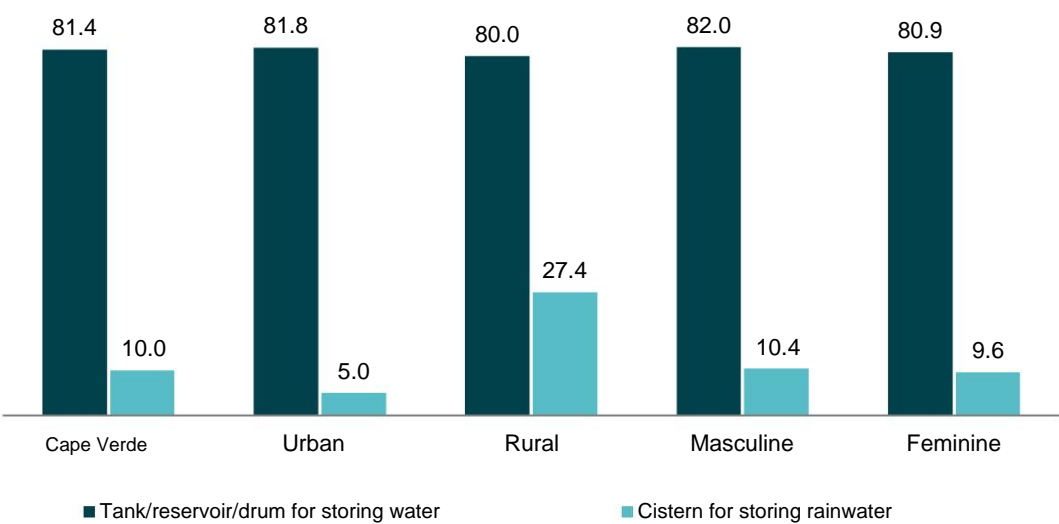

Table 2: Percentage distribution of households that in the last 12 months, at some point had insufficient quantities of water to meet their needs needs (%), by residence, municipality and gender of the representative. Cape Verde, 2024

In 2024, the proportion of households that had a tank, reservoir or drum to store water was 81.4% and that of those that had a cistern to store rainwater was 10.0%. The proportion of households that had a cistern was higher in rural areas (27.4%) than in urban areas (5.0%).

Graph 4: Percentage of households that have a tank/reservoir/drum and cistern for water storage, by residence and gender of the representative (%). Cabo Verde, 2024

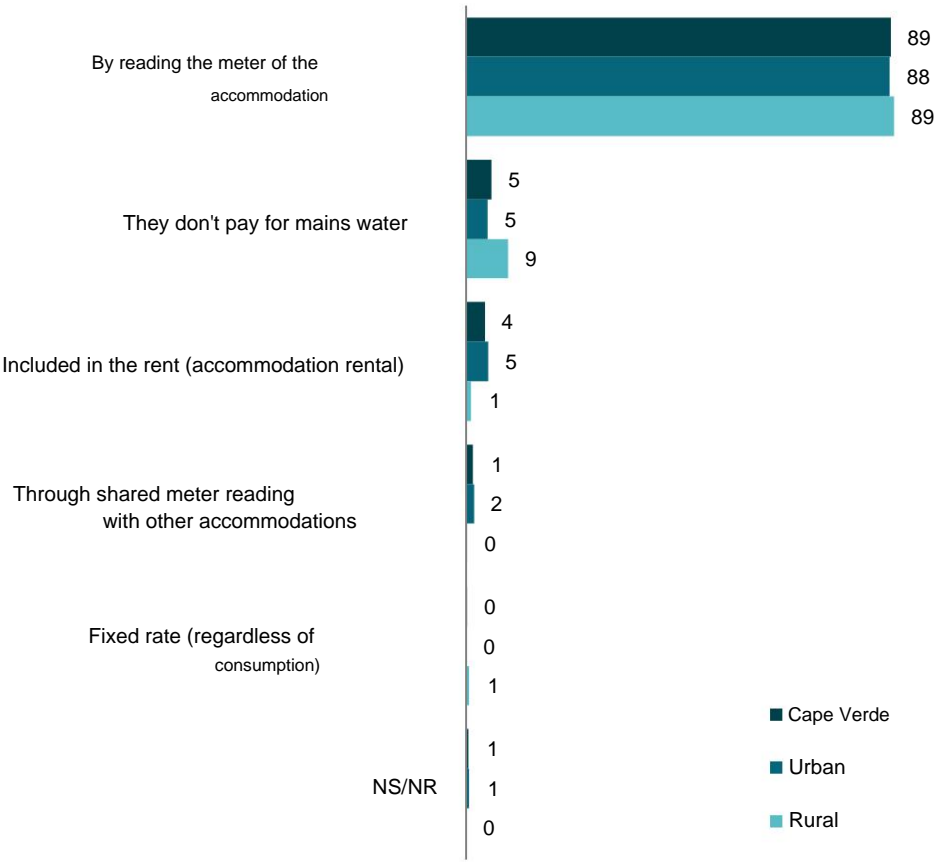

Source: INE, IMC 2024

2.2.2 Public Network

For 89% of households that had a connection to the public water distribution network, consumption was usually charged by reading the meter of the accommodation where they lived, while for 4% of households the amount charged was already included in the rent (accommodation rent). It is important to note that 5% of households with piped water declared that they did not pay for the water they consumed.

Graph 5: Percentage distribution (%) of households, according to the way they are water consumption from the public network is usually charged per residence. Cape Verde, 2024

Source: INE, IMC 2024

Nationally, households paid an average of \$1,563.00 per month. for the public water bill. In urban areas, the average monthly amount paid was \$1,610.00, which is higher than the amount paid in rural areas, which was \$1,367.00. The municipality of Praia was where households paid the most for the monthly bill for the public water bill, with an average monthly amount of \$2,159.00, while in the municipality of Paul the average monthly amount was lower (\$654.00). Households where the representative is male paid an average of \$1,682.00, which is higher than that paid by households where the representative is female: \$1,462.00.

Taking into account the frequency of water supply in the public network in the last month prior to this survey being conducted, 28% of households stated that the supply was daily, 12% that was 4 to 6 times a week, 27% that was 2 to 3 times a week, 21% who went 2 to 4 times a month, 9% who went once a month or less and 2% who did not go at all there was water supply in the network in the last month. The proportion of households where the daily water supply is higher in rural areas, 31%, than in urban areas, 27%. Also the proportion of households where the supply was daily is higher in

households where the representative is female, 29%, of those where the representative is male, 27%.

Source: INE, IMC 2024

2.2.3 Tanker truck

Considering only households whose main form of water supply was the tanker truck, the average amount of water consumed was 2,440 liters and the average associated expenditure was \$2,364.00, in the month prior to the date of this survey. Both the average amount consumed and the average expenditure were higher in rural areas than in urban environment. Households represented by a man consumed and spent more on water from tankers. It should be noted that in the municipalities of Paul, Mosteiros, S. Filipe and Brava had no consumption or expenditure on water transported by tanker truck during the reference period.

2.2.4 Bottled water or water filtered by companies

Taking into account only households that mainly use bottled water or water filtered by companies¹ for drinking, 72% of households used them because they consider them healthier. The proportion that used these types of water because they don't like the taste, smell, color or presence of sediment in the tap water public was 26%.

Graph 7: Percentage distribution (%) of households, according to why they its members drink mainly bottled water or water filtered by companies, through residence. Cape Verde, 2024

Source: INE, IMC 2024

In the week prior to the survey, households that primarily used bottled water or water filtered by companies for drinking spent an average of \$671.00. The average weekly amount spent in rural areas (\$732.00) was higher than that spent in urban areas (\$667.00). Also, the average amount spent in households where the representative is a man (\$732.00) was higher than the average amount spent in households where the representative is a woman (\$653.00).

¹ Commercially filtered water is a source of drinking water that has been filtered or treated by a company that does not have a proprietary brand or container. This water is typically sold on the company's own premises and consumers must bring their own containers or purchase them separately.

2.3 HOUSEHOLDS WITHOUT SANITARY FACILITIES

Considering households without sanitary facilities, that is, those that do not have a toilet or latrine, 64.9% of these usually relieve themselves directly in the open air, 12.3% did it at their neighbors' houses, 12.0% used bucket/bag/sack and threw it in the street, ditch or nature. Still, 10.6% used bucket/bag/sack and threw it into the container, and only 0.2% of these households usually used public toilets to relieve themselves. Observing the percentage distributions by type of residence, it can be seen that only the proportion of households that relieved themselves in the open air was higher in rural areas than in urban areas. For the other options, the proportions were always higher in urban areas. Taking into account the percentage distributions by gender of the representative, it can be seen that households headed by women had higher proportions than those headed by men only in the use of buckets/bags/bags, both for throwing them away later in the street and in the container. Furthermore, the other proportions were higher for households represented by men.

Table 6: Percentage distribution of households without sanitary facilities, according to where the members of these usually did their physiological needs, by means of residence and sex of the representative. Cape Verde, 2024

	Directly in the open air	Neighbors house	Bucket/bag/sack and throw it in the street, ditch or nature	Bucket/bag /bag and threw it in the container	Public bathroom	Total

2.4 WASTE / GARBAGE MANAGEMENT

In 2024, 66.4% of the population in Cape Verde was served or covered by garbage/waste collection through containers and 16.1% was covered by the door-to-door service provided by “garbage trucks”. It should be noted that in some areas and places both coexisted.

types of garbage collection services. In relation to the means of residence, the proportion of urban population served was higher than the rural population, both for the collection made through containers, as well as for door-to-door collection (17.9%). In relation to gender, there were no major differences between the percentages of the male and female populations.

feminine.

Graph 8: Percentage of the population, according to how public waste/waste collection is carried out in the area or place where they live, by residence and sex (%). Cape Verde, 2024

Source: INE, IMC 2024

Only 28% of households were aware that the municipality where they live charges a fee for the collection and management of waste. The municipalities with the highest proportions of households that were aware of this were Maio, Ribeira Grande and Ribeira Brava with 81%, 75% and 69%, respectively. The municipalities those that recorded lower proportions were S. Domingos with 0% and those of Santa Cruz, S. Lourenço dos Órgãos and Ribeira Grande de Santiago, all of them with 2%.

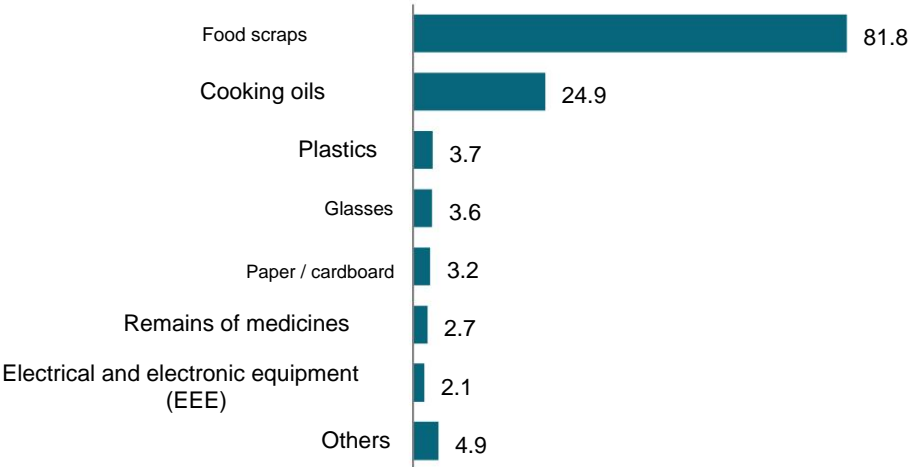

Graph 9: Percentage distribution of households, according to knowledge that the municipality where they live charges a fee for the waste collection and management service, by residence, gender of the representative and municipality (%). Cape Verde, 2024

Source: INE, IMC 2024

During the week prior to the date of this survey, 81.8% of households family members separated food scraps from other waste, 24.9% separated oils food, 3.7% separated plastics, 3.6% separated glass, 3.2% separated paper/cardboard, 2.7% separated leftover medicines, 2.1% separated electrical and electronic equipment (EEE), and 4.9% separated other types of waste.

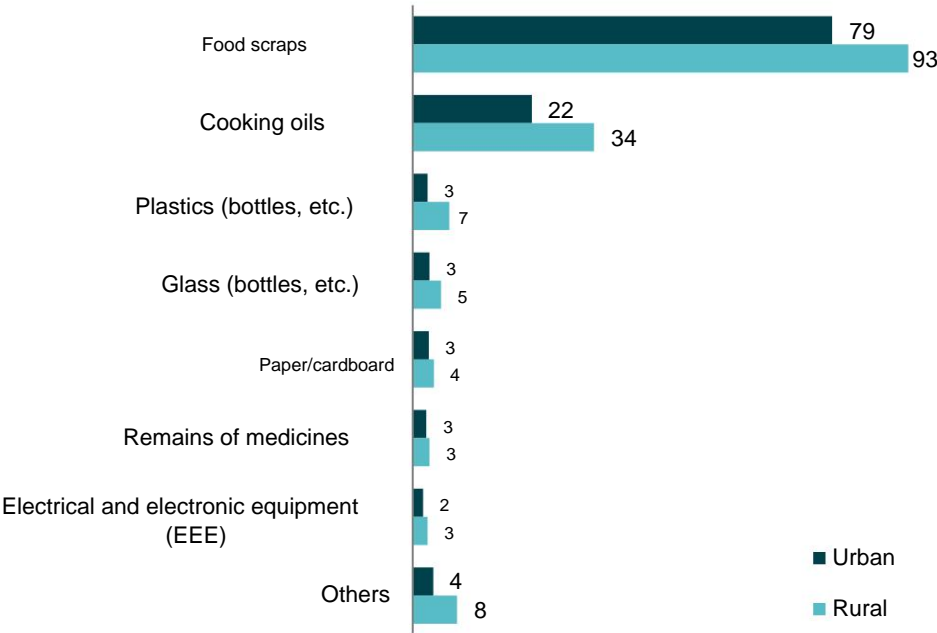

Chart 10: Percentage of households that separated some type of waste/waste during the previous week (%). Cape Verde, 2024

Source: INE, IMC 2024

It should be noted that rural areas have the highest proportions of households that separated any type of waste/garbage during the week prior to the date of this survey.

Chart 11: Percentage of households that separated some type of waste/waste during the previous week, by type of residence (%). Cape Verde, 2024

Source: INE, IMC 2024

Households represented by females had the highest percentages of separating any type of waste/garbage, compared to those represented by a male individual, except in the cases of EEE waste and other types of waste.

Graph 12: Percentage of households that separated some type of waste/waste during the previous week, by gender of representative (%). Cape Verde, 2024

Source: INE, IMC 2024

Of the households that separated food scraps, the three main destinations given to this type of waste were: 68% gave it to animals, 24% sold, donated or exchanged it and 7% put this type of waste in the bin or in the garbage truck. Of those that separated cooking oils, the three main destinations given were: 38% gave it to animals, 21% reused it and 17% sold, donated or exchanged it. Of the households that separated plastics, the three main destinations given were: 50% put it in the bin or in the garbage truck, 31% reused it and 14% burned it. Of those that separated glass, the three main destinations given to this type of waste were: 59% put it in the bin or in the garbage truck, 24% reused and 6% sold, donated or exchanged. Of the households that separated paper or cardboard, the three main destinations given were: 74% put it in the container or in the trash can, 16% burned it and 5% reused it. Of those who separated leftover medicines, the three main destinations given were: 26% put it in the container or trash can, 20% put it in the toilet, sewer, septic tank, etc. and 14% burned it. Of the households that separated electrical and electronic equipment (EEE), the three main destinations given to this type of waste were: 42% kept it, 26% reused it and 16% put it in the container or in the garbage truck.

Graph 13: Percentage distribution of households, according to what they did with each type of waste they separated (%). Cape Verde, 2024

Source: INE, IMC 2024

CAPÍTULO 3

Desastres e Eventos Climáticos Extremos

3 DISASTERS AND EXTREME WEATHER EVENTS

In this chapter, the statistics and indicators obtained from based on data collected through the “Disasters and Extreme Climate Events” module.

3.1 GENERAL

In the 12 months prior to the date of this survey, 17.1% of households family members were affected by dry haze, 12.2% by droughts, 2.6% by heat waves or extreme temperatures, 1.4% by floods or inundations caused by rain, 0.6% by landslides, 0.2% by strong waves or coastal flooding, 0.2% by tropical storms and 0.1% were affected by other weather events extremes.

Chart 14: Percentage of households affected by Extreme Weather Events in the last 12 months (%). Cabo Verde, 2024

Source: INE, IMC 2024

3.2 DRY MIST

Of the 26,963 households that were affected by dry haze in the 12 months prior to the date of this survey, 44% were represented by a man and 56% by a woman. Regarding the means of residence, 80% of these households lived in urban environment, while 20% lived in rural areas.

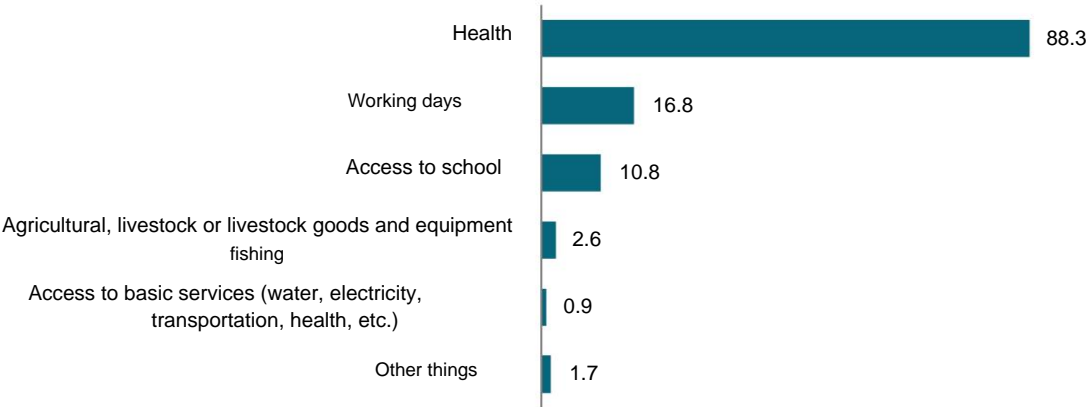

Figure 1: Number (nº) and percentage (%) of households that were affected by Bruma Seca in the last 12 months, by sex of the representative and means of residence. Cape Verde, 2024

Source: INE, IMC 2024

Of the households that were affected by the dry haze, 88.3% had their health affected. its members affected, 16.8% had their working days affected, 10.8% had the access to school was affected, 2.6% had their assets and equipment (agricultural, livestock or fishing) affected, 0.9% had access to basic services (water, electricity, transport, health, etc.) affected and 1.7% were affected in other ways.

Graph 15: Percentage of households according to what the dry haze damaged, destroyed or affected (%). Cape Verde, 2024

Source: INE, IMC 2024

For households whose members' health has been affected by dry haze in the 12 months prior to the date of this survey, the average number of people who stayed sick in these households were 2 people. While this average value was the same in urban households, in rural households it was 3 people per year. The municipality of Ribeira Grande de Santiago was the one that presented the highest average value, 3 people/household/year became ill due to the dry haze. On the other hand, the municipality of Maio was the one that presented the lowest average value, on average 1 person/year became ill for each affected household.

For households whose members' working days were affected by the dry haze, the average number of working days lost was 8 days/year per household. The average in urban areas (8 days/year) was higher than in rural areas (7 days/year). Households in the municipality of S. Filipe had the highest average number of days of work lost due to the dry haze, 93 days/year, while in S. Lourenço dos Órgãos there were no days of work lost in the affected households in that municipality. On average, affected households whose representatives are male had more days lost than those represented by a woman, 9 days/year and 7 days/year.

respectively.

Regarding school days lost, the national average was 2 days per year for every household whose access to school was affected by the dry haze. This value was the same, both for urban and rural households, and for those represented by a man or a woman. In relation to the municipalities, Ribeira Brava had the households with the highest average of school days lost, 6 days/year. On the other hand, the households of the municipalities of Maio, S. Lourenço dos Órgãos, Ribeira Grande de Santiago and S. Filipe did not have on average any school days lost.

As a result of the dry haze, on average 2 members of each affected household were forced to move, temporarily or permanently, to another location.

in the 12 months prior to the date of this survey. This average value remained the even if we consider the disaggregation by means of residence and by sex of the representative. The municipality of Santa Catarina do Fogo recorded the highest average number of individuals per affected household who were forced to move to another location, temporarily or permanently, due to the dry haze: 5 people/year. Meanwhile, 9 municipalities had no households affected by the dry haze where people were forced to move to another location: Paul, S. Vicente, Maio, Praia, S. Domingos, S. Lourenço dos Órgãos, Ribeira Grande de Santiago, Mosteiros and S. Filipe.

For households where the dry haze damaged, destroyed or affected their assets and equipment [housing; cars, motorcycles; agricultural (crops, land, etc.), livestock (animals, etc.) or fisheries (boats, etc.); and used in other economic activities]; estimates of the damage caused by this extreme weather event were requested. The estimated average damage caused by the dry haze in the affected households was \$40,620.00/year. Urban households had a higher average (\$51,3124.00/year) than rural households (\$22,941.00/year). Taking into account the municipalities, Brava had the highest average estimate of losses per affected household: \$300,000.00/year. It is worth noting that in 5 municipalities, the affected households had average estimates of damage equal to \$0.00/year during the period

reference: Paul, S. Vicente, Sal, Maio and S. Filipe. The average damage estimates were higher in households represented by a woman (44,216\$00/year), than those represented by a man (36,281\$00/year).

Table 7: Average number of people who became ill, days of work lost, days of school lost, people who were forced to move to another location and estimated damage caused in households affected by the dry haze, by residence, municipality and gender of the representative. Cabo Verde, 2024

Of the households that were affected by the dry haze, 67.4% of these households did not take any measures to cope with the negative effects of this type of extreme weather event. On the other hand, 22.1% of the households went to a health facility or bought/used masks, medicines or teas. More measures taken by

The affected aggregates were the spending of savings (6.2%), the reinforcement of housing structures (1.6%) and other measures (4.8%).

Graph 16: Percentage of households according to measures taken to address the negative effects caused by dry haze (%). Cape Verde, 2024

Source: INE, IMC 2024

3.3 DROUGHT

Of the 19,276 households that were affected by drought in the 12 months prior to the date of this survey, 49% were represented by a man and 51% by a woman. Regarding the place of residence, 49% of these households lived in urban areas, while 51% lived in rural areas.

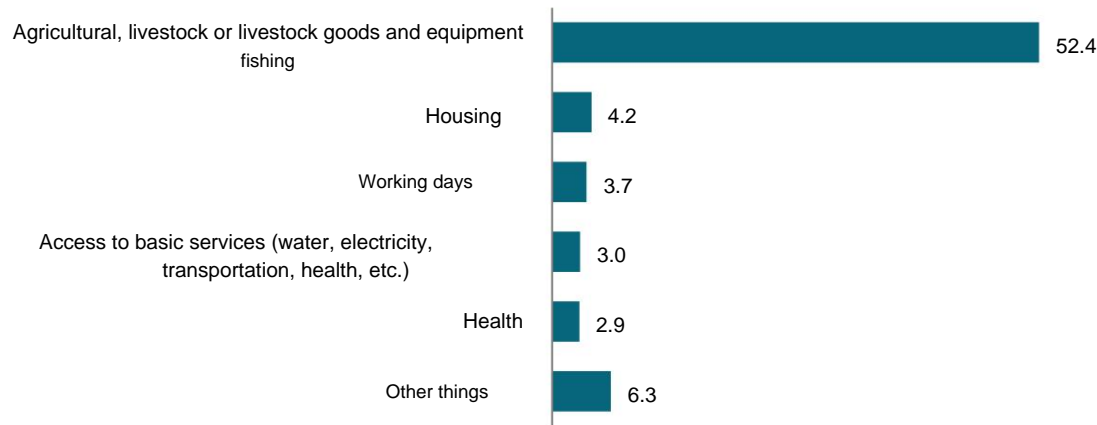

Figure 2: Number (nº) and percentage (%) of households affected by drought in the last 12 months, by gender of the representative and means of residence. Cabo Verde, 2024

Source: INE, IMC 2024

Of the households that were affected by the drought, 52.4% had their assets and equipment (agricultural, livestock or fishing) affected, 4.2% had their housing affected (involving more expenses for the households, as they were deprived of agricultural products and/or had to buy them - in this case these are more expensive in years of drought), 3.7% had their working days affected, 3.0% had access to basic services (water, electricity, transport, health, etc.) affected, 2.9% had the health of their members affected and 6.3% were affected in other things.

Graph 17: Percentage of households according to what the drought damaged, destroyed or affected (%). Cape Verde, 2024

Source: INE, IMC 2024

For households whose members' health was affected by drought in the 12 months prior to the date of this survey, the average number of people who became ill in these households was 2. This average value is the same for both households urban as well as rural areas. The municipality of S. Domingos was the one that presented the highest average value, 4 people/year became ill per household affected due to the drought. On the other hand, 10 municipalities did not have affected clusters where people became ill due to this extreme weather event: Paul, Porto Novo, Ribeira Brava, Tarrafal de S. Nicolau, Sal, Boa Vista, Praia, S. Miguel, Mosteiros and S. Filipe.

For households whose members' working days were affected by the drought, the average number of working days lost was 36 days/year per household. The average in rural areas (50 days/year) was higher than in urban areas (28 days/year). The municipality of Santa Cruz had the highest average number of working days lost due to the drought, 66 days/year. Meanwhile, in the following 10 municipalities there were no days lost working day lost for each affected household:

Filipe and Brava. On average, affected households whose representatives are of the same sex

Males had more days lost than those represented by a woman, 37 days/year and 35 days/year respectively.

Regarding school days lost, the national average was 2 days per year for each household whose access to school was affected by the drought. This figure was the same for both urban and rural households. Only the affected households in the municipalities of Tarrafal, Santa Catarina and S. Domingos had school days lost, on average 3 days/year, 2 days/year and 2 days/year, respectively. Also, only the affected households represented by a woman lost school days due to the drought,

on average 2 days/year.

On average, 2 members of each affected household were forced to move, temporarily or permanently, to another location within 12 months prior to the date of conducting this survey as a consequence of the drought. This average value remained the same when considering the disaggregation by means of residence and by the representative's sex. The municipality of Santa Catarina do Fogo recorded the highest average number of individuals per affected household who were forced to move to another location, temporarily or permanently, due to the drought: 8 people/year. Meanwhile, 12

municipalities did not have affected clusters where people were forced to move to other location due to this extreme weather event: Ribeira Grande, Paul, S. Vicente, Ribeira Brava, Sal, Maio, Praia, S. Domingos, S. Lourenço dos Órgãos, Ribeira Grande de Santiago, Mosteiros and Brava.

For households where the drought damaged, destroyed or affected their assets and equipment [housing; cars, motorcycles; agricultural (crops, land, etc.), livestock (animals, etc.) or fisheries (boats, etc.); and used in other economic activities]; estimates of the damage caused by this extreme climate event were requested. The estimated average damage caused by the drought in the affected households was \$52,271.00/year. Households living in urban areas had a higher average (\$63,368.00/year) than households living in rural areas (\$44,941.00/year).

Taking into account the municipalities, S. Vicente had the highest average estimate of losses per affected household: \$250,353.00/year. It should be noted that in 2 municipalities, the affected households had average estimates of damages equal to \$0.00/year during the reference period: Sal and S. Filipe. The average damage estimates were higher in affected households represented by a man (62,749\$00/year) than in those represented by a woman (41,743\$00/year).

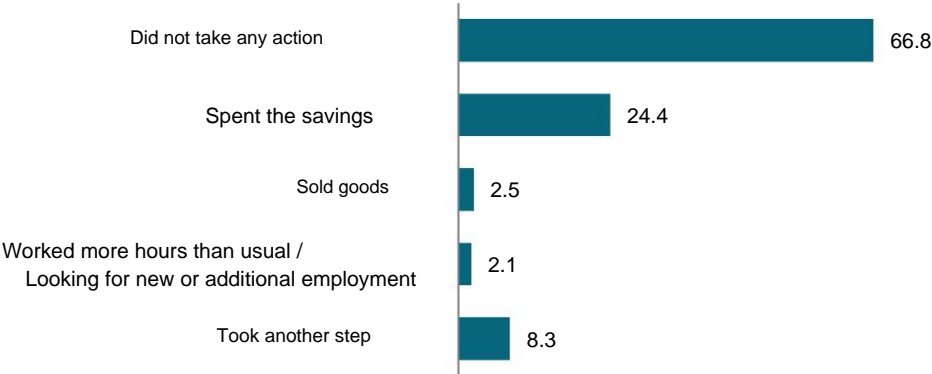

Table 8: Average number of people who fell ill, lost work days, lost school days, people who were forced to move to another location and estimated damages in drought-affected households, by residence, municipality and gender of representative. Cabo Verde, 2024

3.4 HEAT WAVES

Of the 4,085 households that were affected by heatwaves in the 12 months prior to the date of this survey, 46% were represented by a man and 54% by a woman. Regarding the place of residence, 77% of these households lived in urban areas, while 23% lived in rural areas.

Figure 3: Number (nº) and percentage (%) of households affected by heatwaves in the last 12 months, by gender of the representative and means of residence. Cabo Verde, 2024

Source: INE, IMC 2024

Of the households that were affected by the heat waves, 35.9% had the health of their members affected, 4.7% had their assets and equipment (agricultural, livestock or fishing) affected, 3.2% had their working days affected, 1.3% had access to school affected, 1.1% had access to basic services (water, electricity, transport, health, etc.) affected and 1.4% were affected in other ways.

Graph 19: Percentage of households according to what the heatwave damaged, destroyed or affected (%). Cape Verde, 2024

Source: INE, IMC 2024

For households whose members' health has been affected by heat waves

In the 12 months prior to the date of this survey, the average number of people who fell ill in these households was 1 person. This average value is the same in both urban and rural households. In 7 municipalities, the affected households presented an average value of 2 people/year falling ill due to heat waves: Paul, Ribeira Brava, Tarrafal de S. Nicolau, Boa Vista, Santa Catarina, Mosteiros and S. Filipe. On the other hand, 9 municipalities did not have affected clusters where people became ill due to this extreme weather event: Ribeira Grande, Porto Novo, Sal, Maio, Santa Cruz, S. Domingos, S. Lourenço dos Órgãos, Ribeira Grande de Santiago and Brava.

For households whose members' working days were affected by heatwaves, the average number of working days lost was 6 days/year per household.

The average in rural areas (8 days/year) was higher than in urban areas (4 days/year). The municipality of Paul was where the affected households had the highest average of days of work lost due to heat waves, 14 days/year. Meanwhile, in the following 16 municipalities the affected households did not report any lost workdays:

Ribeira Grande, Porto Novo, S. Vicente, Ribeira Brava, Tarrafal of S. Nicolau, Sal, May, Santa Cruz, Praia, S. Domingos, S. Miguel, S. Savior of the World, S. Lawrence of the Organs,

Ribeira Grande de Santiago, S. Filipe and Brava. On average, affected households whose representatives are male had more days lost than those represented by a woman, 6 days/year and 5 days/year, respectively.

Regarding school days lost, the national average was 3 days per year for every household whose access to school was affected by the heat waves. This figure was the same for both urban and rural households. Only the affected households in the municipalities of Mosteiros and Paul had school days lost, on average 3 days/year in each of them. Also, only the affected households represented by a man lost school days due to heat waves, on average 3 days/year.

On average, 1 member of each affected household was forced to move, temporarily or permanently, to another location in the 12 months prior to the date of this survey as a result of heatwaves. This average figure was

higher in rural areas (3 people/year) than in urban areas (1 person/year). The

The municipalities of Tarrafal de S. Nicolau, Mosteiros and Santa Catarina do Fogo recorded the highest average number of individuals per affected household who were forced to move to another location, temporarily or permanently, due to heat waves: 3 people/year.

Meanwhile, 16 municipalities did not have affected clusters where people were forced to move to another location due to this extreme weather event, these were the cases of: Ribeira Grande, Paul, Porto Novo, S. Vicente, Ribeira Brava, Sal, Maio, Santa Catarina, Santa Cruz, Praia, S. Domingos, S. Miguel, S. Salvador do Mundo, S. Lourenço dos Órgãos,

Ribeira Grande de Santiago and Brava. In relation to the sex of the representative, the households affected family members represented by a woman had a higher average (2 people/year) compared to those represented by a man (1 person/year).

For households where heatwaves damaged, destroyed or affected their property and equipment [housing; cars, motorcycles; agricultural (crops, land, etc.), livestock (animals, etc.) or fisheries (boats, etc.); and used in other economic activities]; estimates of the damage caused by this extreme weather event were requested. The estimated average damage caused by heatwaves in the affected households was \$34,044.00/year. Households living in rural areas had a higher average (\$34,393.00/year) than households living in urban areas.

(33,818\$00/year). Considering the municipalities, Boa Vista had the highest average estimate of losses per affected household: 100,00\$00/year. It should be noted that in most municipalities, 15 in total, the affected households had average estimates of damages equal to 0\$00/year during the reference period: Ribeira Grande, Paul, Porto Novo, S. Vicente, Tarrafal de S. Nicolau, Sal, May, Santa Cruz, Beach, S. Domingos, S. Miguel, S. Lourenço dos Órgãos, S. Filipe, Santa Catarina do Fogo and Brava. The average damage estimates were higher in affected households represented by a man (35,656\$00/year) than in those represented by a woman (33,050\$00/year).

CAPÍTULO 4

Ambiente e Clima

4 ENVIRONMENT AND CLIMATE

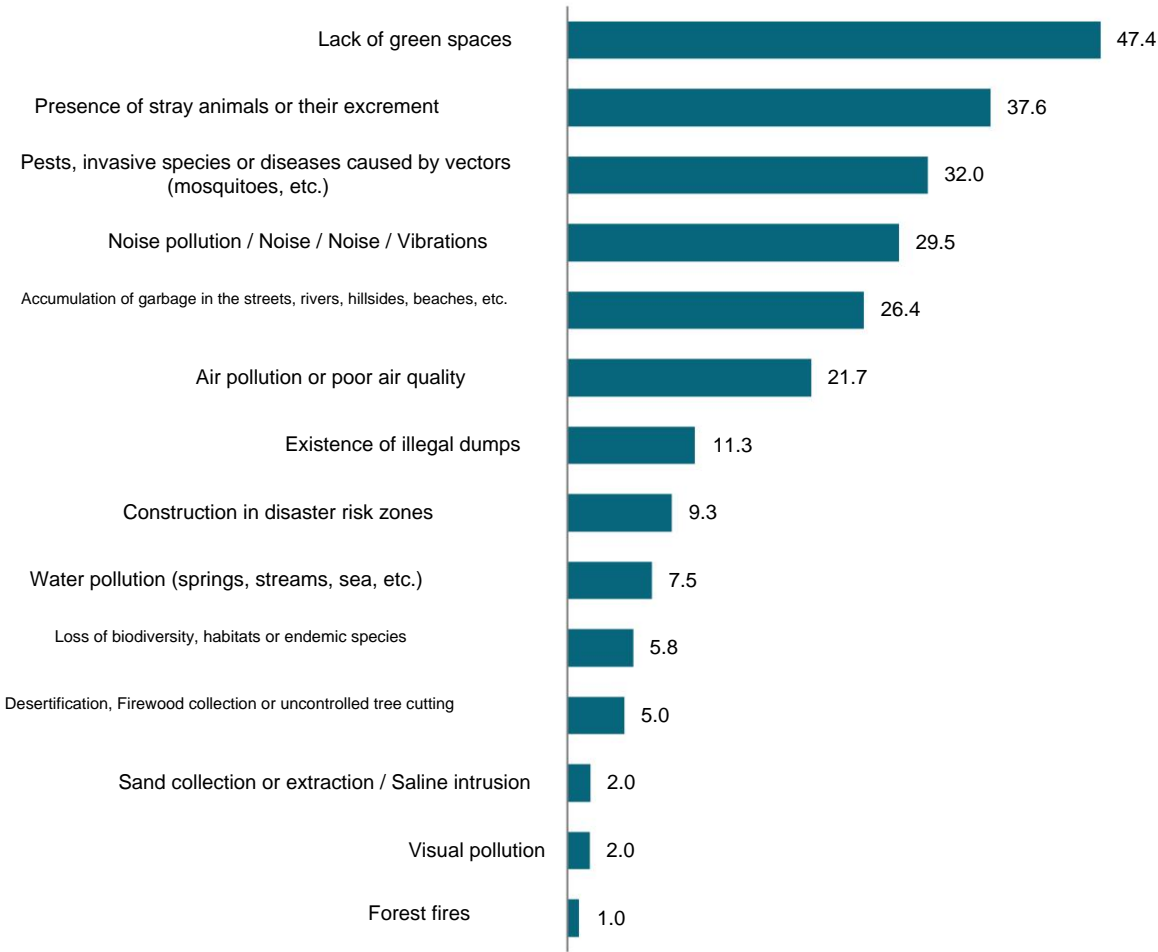

In this chapter, the statistics and indicators obtained from based on data collected through the “Environment and Climate” module.

4.1 ENVIRONMENT

4.1.1 Environmental Knowledge and Awareness

The environmental problem that most affected the population aged 15 or over in their neighborhoods, areas and places was the lack of green spaces, according to the opinion of 47.4% of this population. Next comes the presence of stray animals or their excrement with 37.6%; pests, invasive species or diseases caused by vectors (mosquitoes and others) with 32.0%; noise pollution / Noise / Noise / Vibrations with 29.5%; and accumulation of garbage in streets, rivers, slopes, beaches, etc., with 26.4%.

Graph 21: Percentage of the population aged 15 or over, according to the environmental problems affecting their neighborhood, area or place (%). Cape Verde, 2024

Source: INE, IMC 2024

For 28% of the population aged 15 or over in Cape Verde, the environmental situation in their neighborhood, area or place was not a concern, while for 35% it was of little concern. On the other hand, 24% of this population considered the environmental situation in these places to be of concern and 12% considered it to be of great concern. In general, the situation in rural areas was better than in urban areas. The proportion that considered the situation of little concern was greater in the urban population, while in rural areas the greater proportion was that considered the situation to be of no concern. Taking into account gender, it can be said that the male population considered that the environmental situation in their neighborhood, area or place was slightly better than the population of the opposite sex. Considering the population by gender,

age group, it can be seen that the population aged 65 and over considered that the situation environmental is better. In contrast, the age group between 25 and 34 years old was the one that had the highest proportions of individuals who felt that the environmental situation in their neighborhood, area or place was very worrying.

Graph 22: Percentage distribution of the population aged 15 and over, according to the level of concern about the environmental situation in their neighborhood, area or place, by residence, sex and age group (%). Cape Verde, 2024

Source: INE, IMC 2024

4.1.2 Behavior and Environmental Habits

Considering the population aged 15 or over who found the environmental situation in their neighborhood, area or place to be worrying or very worrying, only 23.2% made some kind of effort to improve or resolve this situation at a national level. In terms of disaggregation by means of residence, it can be considered that there was no great difference between the percentage of the urban population and that of the rural population. In relation to sex, the proportion of the male population that made some kind of effort to improve or resolve this environmental situation (24.4%) was slightly higher than that of the female population (22.2%). In terms of age group, individuals between 35 and 64 years old had the highest percentage (25.3%) and those aged 65 or over had the lowest percentage (13.9%) of individuals who made some type of effort to improve or resolve the environmental situation in their neighborhood, area or place.

Chart 23: Percentage of the population aged 15 and over who have made some kind of effort to improve or resolve the environmental situation in their neighborhood, area or place, by residence, sex and age group (%). Cabo Verde, 2024

Source: INE, IMC 2024

Of the population aged 15 or over who made some kind of effort to improve or resolve the environmental situation in their neighborhood, area or place, 47% reported it to the authorities competent, 42% spoke to the potential suspect who caused the worrying or very worrying environmental situation and 53% got involved or did something directly to overcome or resolve the problem. In urban areas this last initiative was also the most taken, with 53%, while in rural areas the most common initiative taken was to report the incident to the competent authorities, with 46%. For both the male and female populations, the greatest effort made to improve or resolve the environmental situation in their neighborhood, area or place was to get involved or do something directly to overcome the problem.

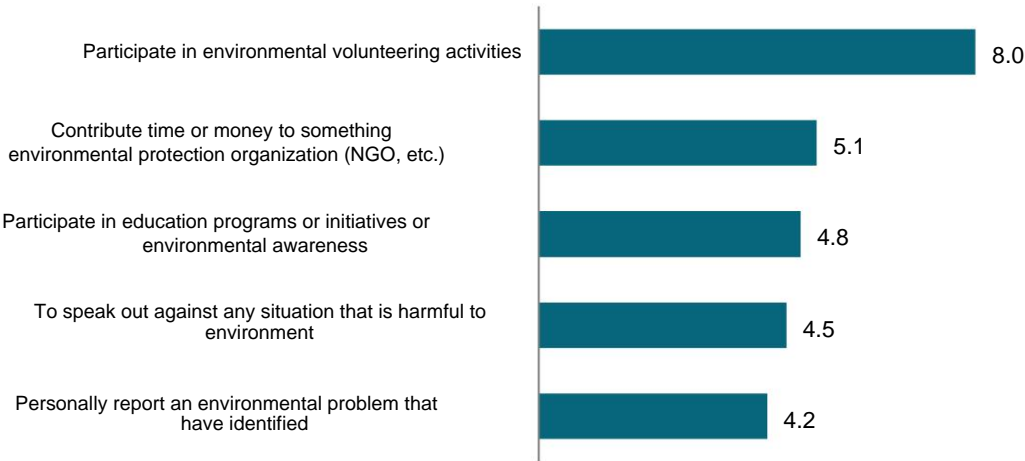

Graph 24: Percentage of the population aged 15 or over, according to the steps taken to improve or resolve the environmental situation in their neighborhood, area or place, by residence and sex (%). Cape Verde, 2024

Source: INE, IMC 2024

The proportions of the population aged 15 and over who, in the 12 months prior to the of this survey, participated in activities related to the environment were the following: 8.0% participated in environmental volunteering actions, 5.1% contributed time or money in some organization in defense of the environment (NGO, etc.), 4.8% participated in environmental education or awareness programs or initiatives, 4.5% spoke out against some situation that was harmful to the environment and 4.2% personally reported an environmental problem that they had identified.

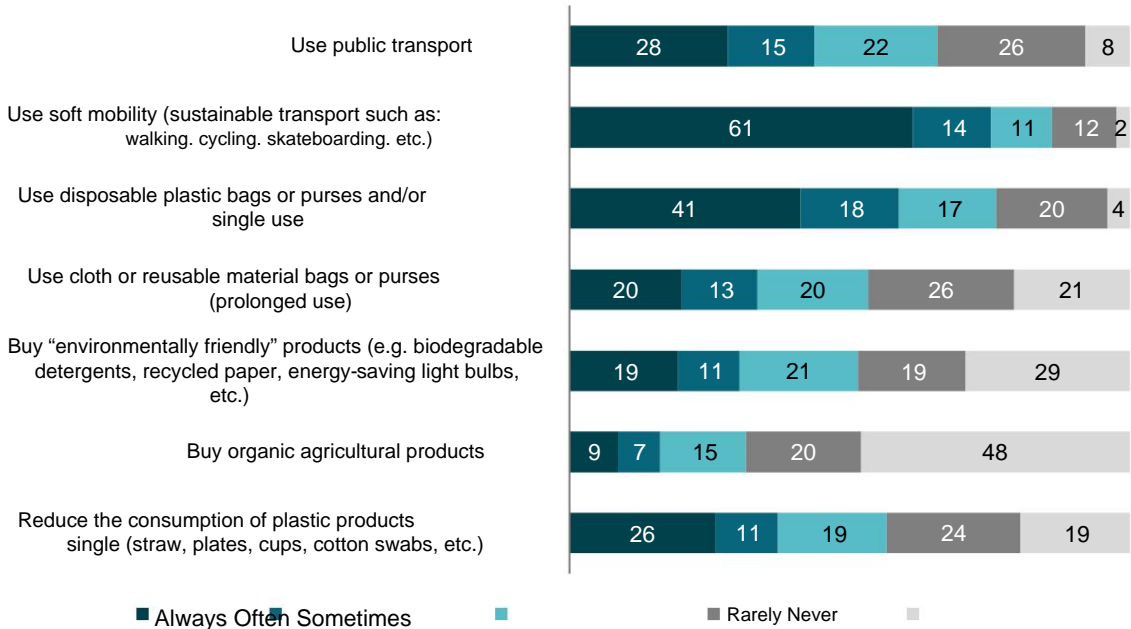

Graph 25: Percentage of the population aged 15 or over who participated in environmental activities in the last 12 months (%). Cape Verde, 2024

Source: INE, IMC 2024

In the 12 months prior to this survey, 28% of the population aged 15 and over always used public transport and 15% used it frequently. More than half of the population, i.e. 61% of them always used soft mobility (sustainable transport, such as walking, cycling, skateboarding, etc.), while only 2% never used this form of mobility. Regarding the use of disposable and/or single-use plastic bags or purses, more than half of individuals aged 15 or over (61%) stated that they had always used them for 12 months. Only 4% of individuals had never used these disposable bags or purses. In contrast, only 20% of the population had the habit of always using cloth or other reusable material bags or purses. The proportion that never used these reusable bags or bags was 21%. Regarding the purchase of “environmentally friendly” products (examples: biodegradable detergents, recycled paper, energy-saving light bulbs, etc.), 19% of individuals aged 15 or over did so always and 11% did so frequently. More than a third of the population (29%) never bought “environmentally friendly” products. It is worth noting that 48% of the population confessed to never buying organic agricultural products² and only 9% always bought this type of product. In terms of reducing the consumption of single-use plastic products (straws, plates, cups, cotton buds, etc.), 26% of individuals stated that they always took this action, while 19% never did it.

Graph 26: Percentage distribution of the population aged 15 and over, according to the frequency of environmental actions in the last 12 months (%). Cape Verde, 2024

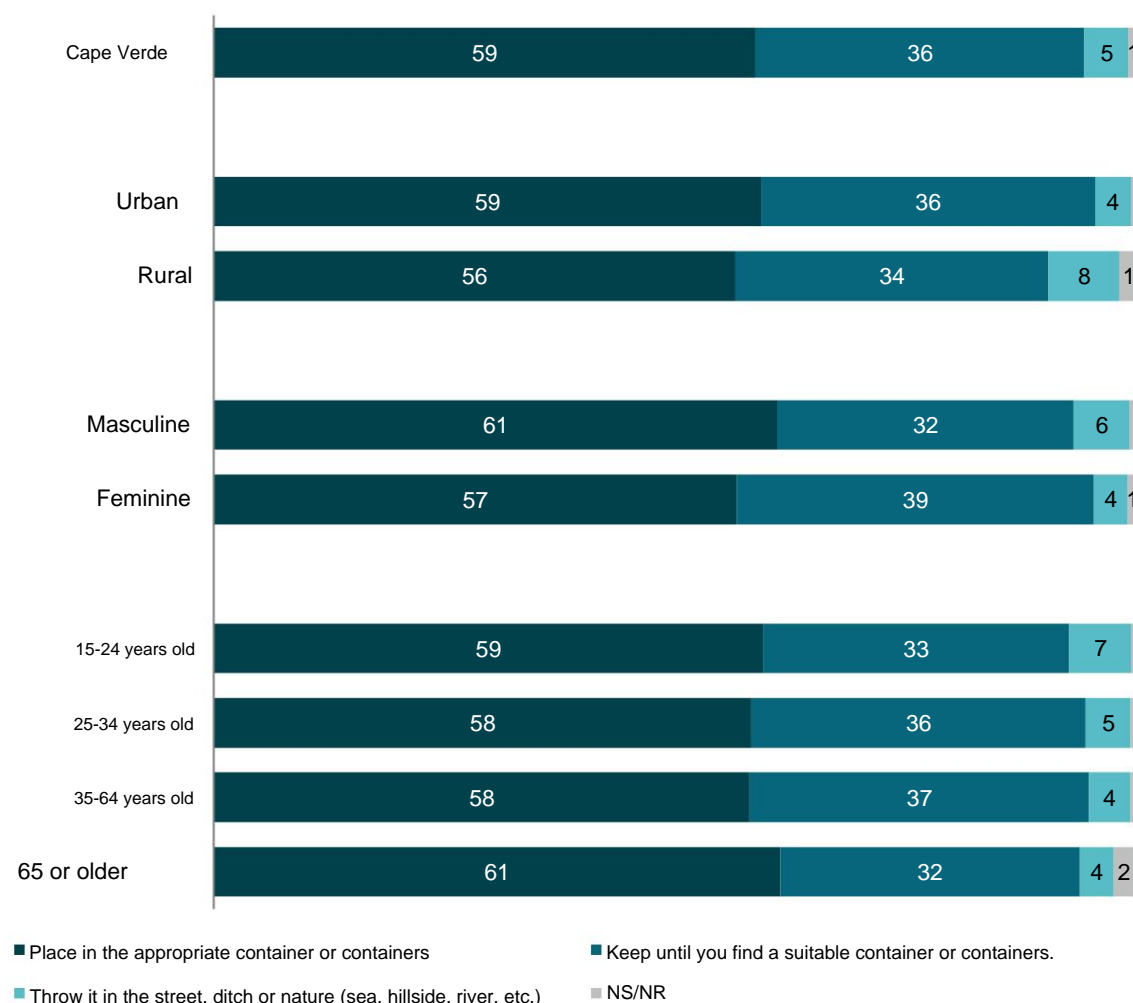

Source: INE, IMC 2024

² Products that are obtained from agriculture that uses natural substances and processes. Organic farming tends to have a limited environmental impact, as it encourages: the responsible use of energy and natural resources; the conservation of biodiversity; the preservation of regional ecological balances; the improvement of soil fertility; and the conservation of water quality.

While in a public space (streets, beach, square, etc.), more than half of the population aged 15 or over, in this case 59%, placed the garbage in the container or in appropriate containers. The proportion of individuals who kept their rubbish until they found an appropriate container or containers was 36%. Only 5% of the population admitted that, while in a public space, they threw their rubbish in the street, ditch or nature (sea, hillside, river, etc.). In rural areas, there was a higher proportion of individuals throwing their rubbish in the street, ditch or nature (8%) than in urban areas (4%). Taking into account the gender of the population, although men had a higher percentage of placing their rubbish in the container or appropriate containers (61%) than women (57%), they also had a higher proportion of throwing their rubbish in garbage in the street, ditch or nature (6%) than women (4%). Comparing the age groups, individuals aged 65 had a higher percentage of placing garbage in the container or appropriate containers (61%) and individuals aged 15 to 24 had a higher percentage of throwing garbage in the street, ditch or nature (7%).

Graph 27: Percentage distribution of the population aged 15 and over, according to what they normally do with rubbish when they are in a public space (streets, beach, square, etc.), by residence, sex and age group (%). Cape Verde, 2024

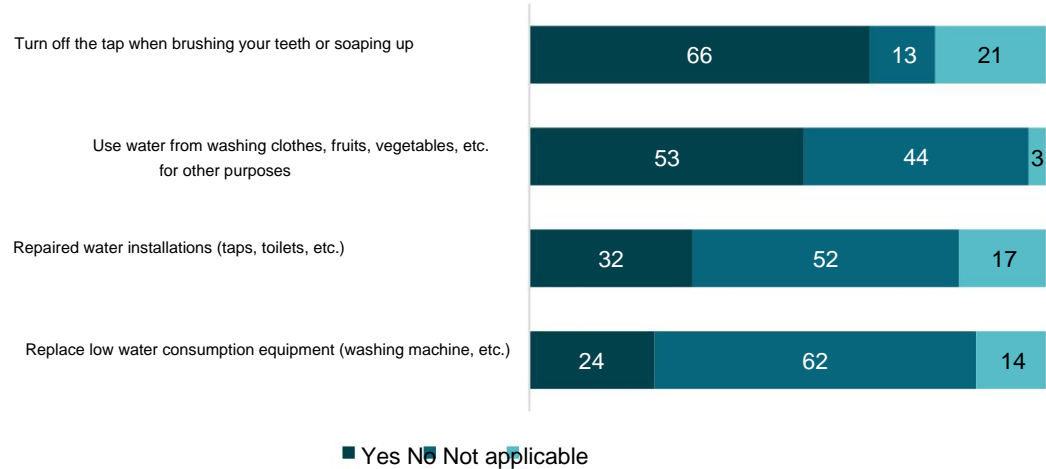

Source: INE, IMC 2024

4.1.3 Practices to Reduce Water Consumption

In the 12 months prior to this survey, 61% of the population aged 15 and over turned off the tap when brushing their teeth or soaping themselves, 53% reused water from washing clothes, fruit, vegetables, etc. for other purposes, 32% repaired or had repaired water installations (taps, flush toilets, etc.) and 24% replaced the equipment that had others with low water consumption (washing machine, taps, etc.).

Graph 28: Percentage distribution of the population aged 15 and over, according to the implementation of practices to reduce water consumption in the last 12 months (%). Cape Verde, 2024

Source: INE, IMC 2024

4.2 KNOWLEDGE AND PERCEPTION ABOUT CLIMATE CHANGE

The percentage of the population aged 15 or over in Cape Verde who had heard about Climate Change or Climate Change was 68%. In urban areas, this percentage (72%) was higher than in rural areas (54%). The proportion of the male population (72%) who had heard about Climate Change was higher than the female population (65%). In terms of population age, individuals between 15 and 24 years old were the ones who registered highest percentage of individuals who have heard about Climate Change, at 80%. In contrast, individuals aged 65 or over had a lower percentage, at 50%.

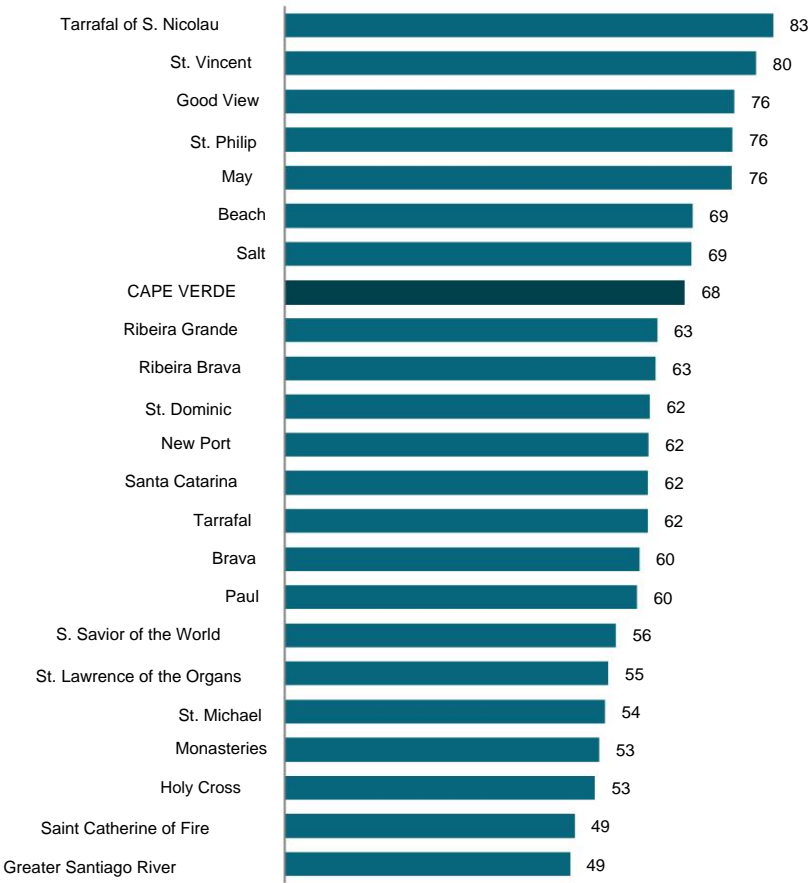

Figure 4: Percentage of the population aged 15 and over who have heard about Climate Change or Climate Change, by residence, sex and age group (%).
Cape Verde, 2024

Source: INE, IMC 2024

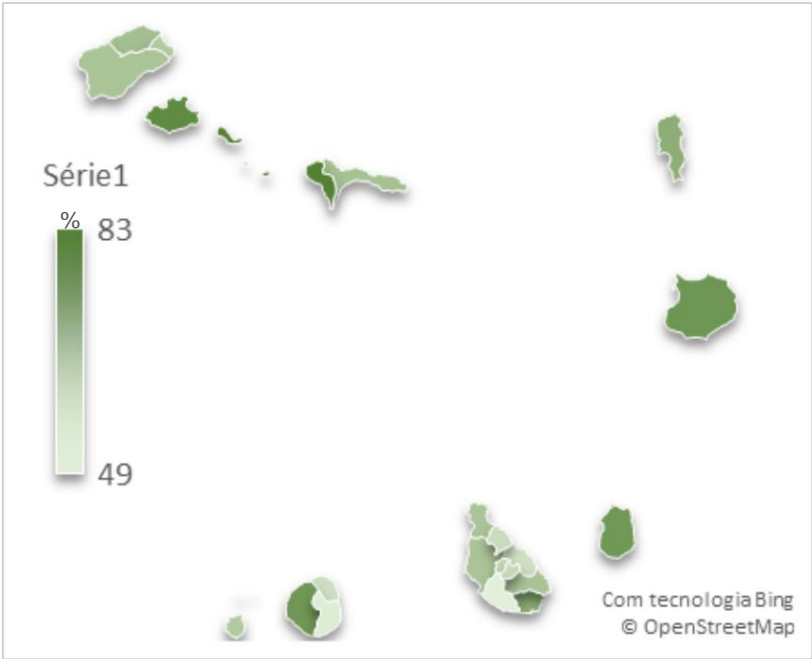

The municipality of Tarrafal de S. Nicolau was where the highest percentage (83%) of the population aged 15 who had heard about Climate Change or Climate Change was recorded. Next came S. Vicente and Boa Vista with 80% and 76%, respectively. The municipalities with the lowest proportions of the population who had heard about Climate Change were: Ribeira Grande de Santiago, Santa Catarina do Fogo, both with 49%, and Santa Cruz, with 53%.

Graph 29: Percentage of the population aged 15 or over who have heard about Climate Change or Climate Change, by municipality (%). Cape Verde, 2024

Source: INE, IMC 2024

Figure 5: Percentage of the population aged 15 or over who have heard about Climate Change or Climate Change, by municipality (%). Cape Verde, 2024

Source: INE, IMC 2024

Considering only the population that has heard about Climate Change, the majority of them, in this case 75.4%, considered that what defines Climate Change is the increase air temperature. On the other hand, 42.3% of this population considered the change in seasons as one of the best definitions. The third most identified definition for Climate Change was the increase in the number of disasters and extreme weather events with a percentage of 40.9%. It is worth noting that only 1.5% of the population, who has heard about Climate Change, did not know or did not respond about what best defines Climate Change.

Graph 30: Percentage of the population aged 15 or over, according to how Climate Change is best defined (%). Cape Verde, 2024

Source: INE, IMC 2024

The proportion of the population aged 15 and over who thought that the use of fossil fuels (oil, coal and natural gas) is a major cause of climate change was 81.0%. The percentage who thought that deforestation is a cause was 55.3%. In contrast, 29.6% of individuals aged 15 and over thought that climate change has non-human causes, that is, that it is not caused by human activities. However, 15.8% considered that one of the causes is livestock farming and consequent impacts. Only 2.4% of the population has heard of the Changes Climate, did not know or did not respond about what they thought were the main causes of Climate Change.

Graph 31: Percentage of the population aged 15 and over, according to what they thought were the main causes of Climate Change (%). Cape Verde, 2024

Source: INE, IMC 2024

The vast majority of the population aged 15 or over (85%) felt concerned about Climate Change and its impacts, while 9% did not feel concerned and 6% felt indifferent. In rural areas, there was a proportion of individuals who did not feel concerned (11%), slightly higher than in urban areas (8%). In terms of male and female populations, there were no major differences to mention. In terms of age, the population aged 65 was the one that felt most concerned about Climate Change. with 90%. On the other hand, individuals between 15 and 24 years old felt less worried, that is, 79%.

Graph 32: Percentage distribution of the population aged 15 and over, according to their concern about Climate Change and its impacts, by residence, sex and age group (%). Cape Verde, 2024

Source: INE, IMC 2024

Exactly three quarters (75%) of the population aged 15 and over considered that Climate Change threatens or will threaten the well-being of their household, while 20% did not consider it a threat and 5% felt indifferent. In rural areas, there was a proportion of individuals considering Climate Change as a threat to the well-being of their household (77%), slightly higher than in urban areas (74%). In terms of male and female populations, there were no major differences to mention. In terms of age, the population aged 25 to 34 was the one with the highest proportion considering Climate Change as a threat to the well-being of their household, at 78%. In contrast, individuals aged 15 to 24 were the who had a lower proportion considering this, at 69%.

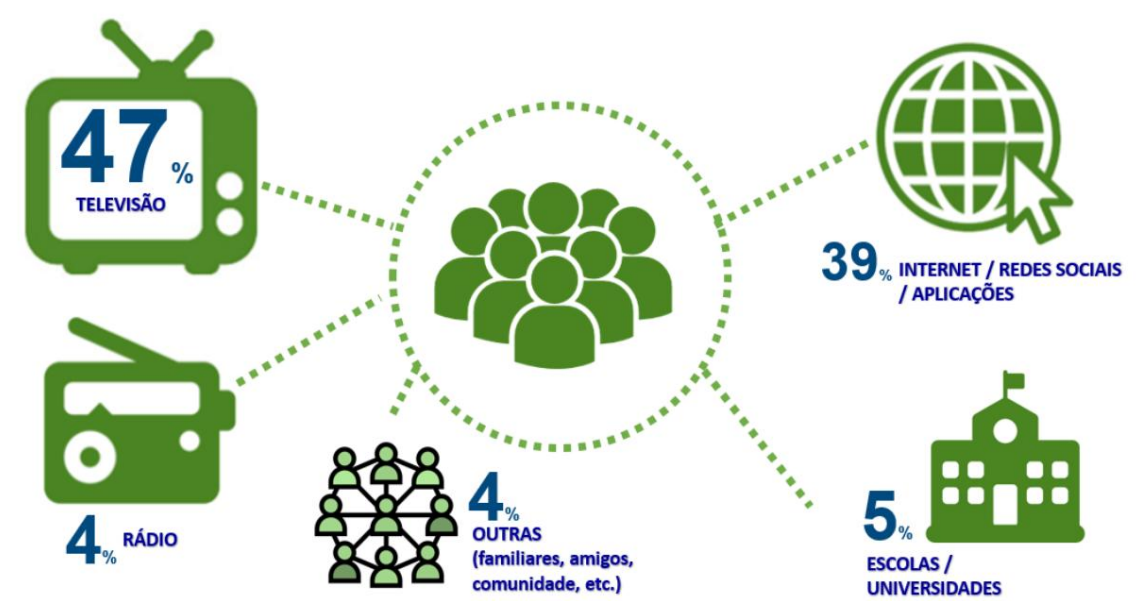

Graph 33: Percentage distribution of the population aged 15 and over who consider that Climate Change threatens or will threaten the well-being of their household, by residence, sex and age group (%). Cabo Verde, 2024

Source: INE, IMC 2024

The main source used by the population aged 15 and over to obtain information about Climate Change was Television, with 47%. Next comes the Internet/Social Networks/Applications, with a proportion of 39%, Schools/Universities, with 5%, Radio, with 4%, and Other sources of information (family, friends, communities, churches, newspapers/paper magazines, employer, etc.), also with 4%.

Figure 6: Percentage distribution of the population aged 15 and over, according to the main source of information used on Climate Change (%). Cabo Verde, 2024

Source: INE, IMC 2024

For 30% of the population aged 15 or over, the main person responsible for combating Climate Change is the responsibility of individuals. Then come international organizations with 23%, developed countries with 20%, national governments with 13%, and others (companies, developing countries, local authorities, NGOs, etc.) with 9%. It is worth noting that 2% of the population considered that everyone is responsible for this fight, while 2% did not consider anyone to be responsible. For all data disaggregation carried out by residence, sex and age group, it was observed that the main people responsible for combating Climate Change were always individuals.

Graph 34: Percentage distribution of the population aged 15 and over, according to who is primarily responsible for combating Climate Change, by residence, sex and age group (%). Cape Verde, 2024

Source: INE, IMC 2024

The graph below shows that 67% of the population aged 15 and over thought that the actions taken by the government to combat the impact of Climate Change were insufficient to address the impacts on people and localities. On the other hand, 28% of people thought that the actions taken were good and sufficient. The greatest discrepancy observed was between the following age groups: 71% of the population aged 25 to 34 considered that the actions taken by the government were insufficient, while 56%

of individuals aged 65 and over considered the same thing.

Graph 35: Percentage distribution of the population aged 15 and over, according to what they think about government actions to combat the impact of Climate Change, by residence, sex and age group (%). Cape Verde, 2024

Source: INE, IMC 2024

Almost a third of the population aged 15 or over, more precisely 32%, thought that the government creates positive incentives to act in response to climate change, while 43% felt that it does not encourage people to act in response to climate change and 21% felt that the government does not communicate enough about climate change. Individuals aged 65 and over were the highest proportion who believed that the government creates positive incentives to act in response to climate change (37%), while individuals aged 25 to 34 had the lowest percentage (27%).

Chart 36: Percentage distribution of the population aged 15 and over, according to their opinion on how the government communicates with the public about climate change, by residence, sex and age group (%). Cape Verde, 2024

Source: INE, IMC 2024

More than three quarters of the population aged 15 or over, exactly 77%, considered that the place where I lived was warmer last year compared to the last 5 years. However, 11% thought the temperature had not changed and 11% thought it had been less hot. The 15 to 24 age group had the highest percentage (79%) of individuals thinking that the place where they lived was warmer, while the 25 to 34 age group had the lowest percentage (74%) of people thinking the same.

Graph 37: Percentage distribution of the population aged 15 or over, according to the comparison of the temperature in the place where they live in the last year with the last 5 years, by residence, sex and age group (%). Cape Verde, 2024

Source: INE, IMC 2024

Only 14% of the population aged 15 or over considered that the place where they lived was more rainy in the last year compared to the last 5 years. In contrast, 73% thought that the last year was less rainy and 12% said nothing had changed in the last 5 years. The biggest contrast was between the urban and rural population: 77% of the urban population considered the last year to be less rainy, while 62% of individuals in rural areas considered the same thing.

Graph 38: Percentage distribution of the population aged 15 or over, according to the comparison of the amount of rain that fell in the place where they live in the last year with the last 5 years, by residence, sex and age group (%). Cape Verde, 2024

Forest fires <input type="checkbox"/> <input type="checkbox"/></div> <div>X. Other. Specify: _____</div>	
A002	To what extent do you think the ENVIRONMENTAL SITUATION is worrying in your neighborhood, area or place? (READ THE MODALITIES)
1 <input type="checkbox"/> Very Worrying 2 <input type="checkbox"/> Worrying 3 <input type="checkbox"/> Not Very Worrying ==> Go to A005 4 <input type="checkbox"/> Not Worrying ==> Go to A005 9 <input type="checkbox"/> NS/NR ==> Go to A005	
ENVIRONMENTAL BEHAVIOR AND HABITS	
A003	Have you made any kind of effort to improve or resolve this environmental situation in your neighborhood, area or place?
1 <input type="checkbox"/> Yes 2 <input type="checkbox"/> No ==> Go to A005 9 <input type="checkbox"/> NS/NR ==> Go to A005	
A004	What did you do to improve or resolve this environmental situation? (READ THE TYPES)
<div>1. Yes 2. No</div> <div>A. Communicated to the competent authorities <input type="checkbox"/> <input type="checkbox"/></div> <div>B. Spoke to the potential suspect <input type="checkbox"/> <input type="checkbox"/></div> <div>C. Got involved to overcome the problem <input type="checkbox"/> <input type="checkbox"/></div>	

X. Other. Specify: _____

☐ ☐

A005

In the last 12 months, you have participated in the following activities: (READ THE TYPES)

1.Yes 2.No

A. Donate time or money to an organization that defends the environment (NGO, etc.) ☐ ☐ B. Participate in environmental volunteering activities ☐ ☐ ☐C. Demonstrate against any situation that is harmful to the environment ☐ ☐ ☐D. Personally report an environmental problem you have identified ☐ ☐ ☐E. Participate in environmental education or awareness programs, initiatives ☐ ☐

A006

In the last 12 months, indicate how often you performed any of the following actions: (READ OUT MODALITIES)

1. Always 2. Often 3. Sometimes 4. Rarely 5. Never 99. DK/NR

A. Use public transport ☐B. Use soft mobility (sustainable transport) such as: walking, cycling, skateboarding, etc.) ☐ ☐C. Use disposable and/or single-use plastic bags or purses ☐D. Use cloth or reusable material bags or sacks (long-term use) ☐E. Buy "environmentally friendly" products (e.g. biodegradable detergents, recycled paper, energy-saving light bulbs, etc.) ☐F. Buy organic agricultural products ☐G. Reduce the consumption of single-use plastic products (straws, plates, cups, cotton buds, etc.) ☐

A007

What means of transport do you usually use to travel (from home to work, school, etc.)?

1 ☐ Not applicable / No travel 2 ☐ On foot

==> Go to A009

3 ☐ Bicycle4 ☐ Draft or pack animal (donkey, horse, etc.)5 ☐ Motorcycle, moped, tricycle or quadricycle 6 ☐

Car belonging to a member of your household (including hiace, galucho, hilux, truck, etc.)

7 ☐ Public transport or other people's cars (including hiace, galucho, hilux, truck, taxi, etc.)8 ☐ Transportation from the company/organization/institution where you work9 ☐ Other. Specify: _____99 ☐ NS/NR

==> Go to A009

A008

What is the main reason for using this means of transport?

1 ☐ Convenience 2 ☐☐ Necessity3 ☐ Security4 ☐ Environmental Awareness5 ☐ Sports / Health6 ☐ Save money7 ☐ Lack of financial means8 ☐ Proximity9 ☐ Fuel price88 ☐ Other. Specify: _____99 ☐ NS/NR

A009	What do you usually do with rubbish when you are in a public space (streets, beach, square, etc.)?
<p>1 <input type="checkbox"/> Place in the appropriate container or containers</p> <p>2 <input type="checkbox"/> Lay on the street, ditch or nature (sea, hillside, river, etc.)</p> <p>3 <input type="checkbox"/> Keep until you find a suitable container or containers 8 <input type="checkbox"/> Other.</p> <p>Specify: _____</p> <p>9 <input type="checkbox"/> NS/NR</p>	
PRACTICES TO REDUCE ELECTRICITY AND WATER CONSUMPTION	
A010	In the last 12 months, have you done any of the following to reduce your electricity consumption?
<p style="text-align: right;">1. Yes 2. No 8. NA 9. DK/NR</p> <p>A. Replace electronic equipment/lamps with low-consumption equipment <input type="checkbox"/> </p> <p>B. Unplug electrical appliances and tools when not in use <input type="checkbox"/> C. Turn off lights when not in use <input type="checkbox"/> <input type="checkbox"/> <input type="checkbox"/></p> <p>D. Reduce frequent use of electronic equipment</p> <p>X. Others. Specify: _____</p>	
A011	In the last 12 months, have you done any of the following to reduce your water consumption?
<p style="text-align: right;">1. Yes 2. No 8. NA 9. DK/NR</p> <p>A. Replace low water consumption equipment (washing machine, etc.) <input type="checkbox"/></p> <p>B. Reuse water from washing clothes, fruits, vegetables, etc. for other purposes <input type="checkbox"/></p> <p>C. Turning off the tap when brushing your teeth or soaping yourself <input type="checkbox"/></p> <p>D. Repair broken water installations (taps, toilets, etc.), including leaks <input type="checkbox"/></p> <p>X. Others. Specify: _____ <input type="checkbox"/></p>	
KNOWLEDGE AND PERCEPTION ABOUT CLIMATE CHANGE
