Preface

The Compendium of Environment Statistics 2023 (CES 2023) is an outcome of a participatory process by Ministries, Departments and Agencies (MDAs) in the field of environment. This was made possible by the active participation of various experts from the member institutions who constitute the Environment Statistics Technical Committee (ESTeC).

The following are the institutions that participated in the production of the report: Kenya National Bureau of Statistics (KNBS); Ministry of Environment, Climate Change and Forestry (MECCF), Ministry of Water, Sanitation and Irrigation (MoWSI); Ministry of Tourism and Wildlife (MoTW); Ministry of Mining, Blue Economy and Maritime Affairs; Climate Change Secretariat (CCS); Kenya Wildlife Service (KWS);Kenya Forestry Service (KFS); Kenya Meteorological Department (KMD); Nairobi City County Government; National Museums of Kenya (NMK); National Environmental Management Authority (NEMA); Directorate of Resource Surveys and Remote Sensing (DRSRS); Water Resources Authority (WRA); Kenya Fisheries Service (KeFS); National Disaster Operation Centre (NDOC), and the Council of Governors.

This publication has been prepared as per the guidelines of the United Nation Framework for the Development of Environment Statistics (UNFDES) on useful data sets and analysis. The report covers a wide range of environment topics to facilitate one stop access and use of environment statistics for evidence-based decision making. The report provides statistics for monitoring of national, regional, and global development frameworks such as Kenya Vision, 2030; the Medium-Term Plans; the Africa Development Agenda, 2063; the Sendai Framework for Disaster Risk Reduction, 2015–2030; the Paris Climate Agreement 2015 and the Sustainable Development Goals, 2030 (SDGs, 2030). This report provides a comprehensive scenario of the environmental situation of the country and provides an important instrument for policy integration and informed decision making.

Most statistics in this report have been gathered from surveys, censuses, and administrative sources from various institutions that are charged with responsibilities of collecting, analysing and archiving such data. There is thus great possibility that some of the data presented here are available in other publications already. Notwithstanding the foregoing, there are still data gaps that would need to be addressed to comprehensively meet the high and growing demand for environment data and statistics. The Kenya National Bureau of Statistics in collaboration with other stakeholders will put more efforts to fill the identified data gaps and update this publication biannually.

Production of this report would not have been successful without the collaboration of various participants who contributed valuable inputs throughout the process. In this regard, I wish to extend special thanks to the heads of Ministries, Departments, Counties and Agencies (MDCAs) from which members of the Environment Statistics Technical Committee (ESTeC) on environment statistics were appointed. I equally extend special thanks to the dedicated technical officers from KNBS that worked

tirelessly to develop this report under the leadership of Mr.Paul Nderitu, Senior Manager with his team including Mr. James Munguti, Mr. Abdi Mohamud, Mrs. Lillian Onono and Mr. Simon Maundu.

I also wish to extend my sincere gratitude to the United Nations Statistics Division (UNSD), the East African Community (EAC) Secretariat and Statistics Sweden (SCB) under the KNBS SCB statistical cooperation project for their technical support.

My heartfelt appreciation go to The Common Market for Eastern and Southern Africa (COMESA) for the financial support provided from the European Union, through the European Development Fund (EDF) COMESA Institutional Capacity Building Programme (ICBP), that faciltiated the national workshops and data validation for the finalisaiton of this compedium on environment statistics.

In addition, this work received the much needed technical expertise from COMESA's Statitical Capacity Building Programme phase 5 (SCB-V) consultants on Environmental and Climate Change Statistics Anand Sookun, (PhD) and Mr Gerard Barutwanayo. Special thanks to Ms. Ngawo Banda – COMESA Agricultural Statistician for her valuable technical support, without this collaboration, this work wouldn't have been possible.

I also appreciate the substantial technical contribution made by Jonas Bergström and Julia Hytteborn, environment experts from Statistics Sweden led by Peter Nilsson, KNBS/Statistics Sweden Project Senior Advisor. KNBS welcomes comments and suggestions regarding this report and for improving quality of future reports. All comments and suggestions should be addressed to the Director General, Kenya National Bureau of Statistics, P.O. Box 30266 00100, Nairobi, e-mail dg@knbs.or.ke.

Macdonald G. Obudho, PhD,EBS, MBS
Director General

WPDA	World Database Protected Area
WRA	Water Resources Authority

FDES STRUCTURE

BACKGROUND, METHODOLOGY, CONCEPTS AND DEFINITIONS

1. Background

The demand for environmental statistics is increasing in tandem with the ongoing environmental challenges faced by societies. These challenges emanate from use of technology, population pressure, energy issues, sustainable development and climate change. The realization that human wellbeing and development depend on the environment has led to an increasing emphasis on the environment and sustainability concerns on which decisions and actions need to be taken. For instance, environment is among the three pillars of sustainable development to ensure environment sustainability is achieved in parallel with social and economic development of the society. Of paramount importance to these actions is the regular production of environment statistics of the highest quality to monitor the performance of national, regional and international development plans, policies and programmes for sustainable development.

Compilation of environmental statistics has been a challenge in the past for Kenya. This is mainly due to the fact that these types of statistics cover a wide range of information and are interdisciplinary in nature. They can be collected from a diverse range of sectors meaning numerous methods require to be applied in their compilation. To effectively produce environment statistics, a number of things must be in place. There must be specific statistical and environmental expertise, scientific knowledge, institutional development capacities and adequate resources.

In strengthening the production and dissemination of environment statistics in the country, an assessment was carried out in 2015 by KNBS in collaboration with the East African Community (EAC) Secretariat on the status of Environment Statistics in the country. The assessment revealed the following challenges: inadequate financial and human resources, inadequate technical capacities and tools/instruments for data collection and lack of institutional coordination.

Following the assessment, a roadmap for implementation of the FDES 2013 was developed by stakeholders in the Environment and Natural Resource sector. EAC Secretariat, as an initial step towards the support to its member countries, undertook to collaborate with the United Nations Statistics Division (UNSD) on the implementation of the FDES 2013. UNSD continued to support EAC in the implementation of FDES 2013 in its member countries through: review of data from national institutions, review of processes related to data collection. In addition, several capacity building workshops were held with support from UNSD to disseminate FDES 2013 among institutions producing environment statistics in Kenya. Likewise, assessments of environment data availability in the country were conducted using data assessment tools. This synergy was realized through the UNSD Development Account Project named, “Supporting Member States in developing and strengthening environment statistics and integrated environmental-economic accounting for improved monitoring of sustainable development” of which Module A focuses on strengthening environment statistics.

Environment statistics therefore, require a proper framework to guide their development, coordination and organization at all levels. It is against the aforesaid background that the Framework for Development of Environment Statistics (FDES) was established.

2. Methodology

Data for the Compendium of Environment Statistics were obtained from results of the surveys or censuses conducted by the KNBS, and the annual reports or publications from institutions that related to environment at the National and County/subnational levels.

As a first step in data collection, the Environment Statistics Technical Committee (ESTeC) was established comprising of key environment data producers and users. Thereafter, quarterly meetings were held with a view to laying plans for data collection. During the meetings, dummy tables were designed based on the FDES 2013 and shared with key institutions for data collection. Data collection was followed by the compilation of the draft compendium which was thereafter validated by the ESTeC. To identify relevant variables, FDES 2013 was used and several indicators were derived for inclusion in the publication.

3. Key Concepts and Definitions

The concepts and definitions used in this compendium are taken from several sources. However, the definitions presented here are the Legal definitions given mainly by either the FDES 2013 or official gazettes and laws establishing relevant institutions.

1. Weather: Weather is the state of the atmosphere of a given place at a given time. The elements of weather include, but are not limited to, rainfall, temperature, pressure, wind, cloud cover and humidity.

2. Climate: Climate is the average weather pattern in a place over a period of at least thirty years as defined by the World Meteorological Organization

3. Climate change: Climate change is a permanent shift in the state of climate that persists for an extended period (decades or longer). It is attributed directly or indirectly to human (anthropogenic) activity that alters the composition of the global atmosphere

4. Climate variability: Climate variability refers to fluctuations or deviations in the mean state of climate over a given period ranging from months, season or years and space when compared to long-term statistics for the same calendar period

5. Environment: The totality of all the external conditions (physical, biological, and socio-economic) affecting the life, development, and survival of an organism.

6. Environmental Impact Assessment (EIA): A systematic examination conducted to determine whether a project, policy, program, etc, will have any adverse impacts on the environment. The EIA also provides plans for mitigation of the adverse effects.

7. Sustainable Use: A use of resources which does not compromise the right to use the same resource (e.g., land, forest, water etc) by future generations.

8. Conservation: Management of human use of organisms or eco-systems so that it may yield the greatest sustainable benefit to present generations while maintaining its potential to meet the needs and aspirations of future generations.

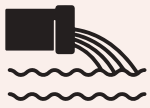
9. Environmental Protection: Any activity to maintain or restore the quality of the environment, through preventing the degradation of air, land, and water resources.

10. Air Pollution: The presence of contaminants or pollutant substances in the air at levels that interfere with the health or welfare of human and other organisms or can produce other harmful environmental effects.

11. Land Degradation: The physical, chemical, or biological impairment of the attributes of land.

12. Eco-system: The complex of plant and animal communities and their inter-relations with each other and with non-living environment.

13. Biodiversity: The total variety of life on earth in all its forms, levels, and combinations. It includes diversity within genetic differences, species differences and eco-system differences in each area.



14. Biological Sludge: The by-product of a biological treatment of effluents (waste products from industries). The biological sludge can then be used for soil improvement. The amount of waste that can be treated with biological means for other useful purposes

15. Biomass: Total living weight (generally dry weight) of all organisms in a particular area or habitat. It is sometimes expressed as weight per unit area of land or per unit volume of water.

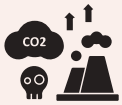
16. Wetland: An area which is permanently or seasonally flooded by water, where characteristic plants and animals have become adapted.

17. Water Catchment Area: An area from which rainwater drains into river systems, lakes and seas.

18. Watershed: An area separating one or more water catchments.

19. Greenhouse Gases: These are Gases that trap the infra-red (heat) radiation in the Earth's atmosphere, producing the greenhouse effect. The two major greenhouse gases are water vapor and carbon dioxide.

20. Greenhouse Effect: The trapping of infra-red (heat) radiation from the Earth's surface in the atmosphere by the greenhouse gases.



21. Greenhouse Gas Emission: It is Emission of those gases that, by affecting the radiation transfer through the atmosphere, contribute to the greenhouse effect.

22. Global Warming: The increase in the average temperature of the earth's atmosphere and oceans that has been observed in the recent decades. Carbon dioxide is responsible for most of global warming, although methane and other greenhouse gases also warm the climate.

23. Emission: Discharge of substances, heat, and sound into the atmosphere,water and soil from sources such as smokestacks, vents, surface areas of commercial or industrial facilities etc.

24. Afforestation: An artificial establishment of a forest by planting or seeding in an area of non-forest land.

25. Reforestation: An artificial establishment of a forest by planting or seeding in an area which was originally a forest.

26. Deforestation: The process of replacement of forests by other land use or vegetation types.

27. Fauna : All animal life.

28. Flora: All plant life.

29. Environmental Sanitation: Improvement of conditions in households that affect human health by means of drainage and disposal of sewage, human excreta, and refuse.

30. Waste: Any material (solid, liquid, or gaseous) discharged into the environment without immediate use.

31. Solid Waste: Any useless and sometimes hazardous material with low liquid content. Solid wastes include municipal garbage, industrial and commercial waste, sewage sludge, wastes resulting from agricultural and animal husbandry operations and other connected activities, demolition wastes and mining residues.

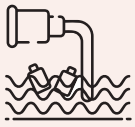
32. Biological Waste: Waste containing natural organic materials (remains of plants, animal excreta, biological sludge from waste-water treatment, plants, etc) and capable of undergoing biological degradation.

33. Agricultural Waste: Any waste produced as a result of various agricultural operations. It includes manure and other wastes from farms, poultry houses and slaughterhouse, harvest waste, fertilizer run-offs from fields, pesticides that enter into water, air or soils, etc.

34. Industrial Waste: Liquid, solid and gaseous wastes originating from the manufacture of specific products.

35. Species: All the individuals and populations of a particular kind of organism maintained by biological mechanisms that result in their breeding only with their own kind.

36. Water Conservation: The control and development of water resources, both surface and underground water, in a manner that promotes sustainable use.



37. Water Pollution: The presence in water of harmful and objectionable materials (obtained mainly from sewers, industrial wastes, and rainwater run-offs) and in sufficient concentrations to make the water unfit for use.

38. Safe Drinking Water: Clean water supplied from an improved water source, such as a borehole/shallow well fitted with a hand pump, or a protected spring or gravity flow scheme, or treated piped water, subject to maintenance of a safe drinking-water chain. Bottled water packed by approved companies is also considered safe water.

39. Sanitation: Encompasses the isolation/management of excreta from the environment, maintenance of personal, domestic and food hygiene, safe disposal of solid and liquid wastes, maintaining a safe drinking-water chain and vector control.

40. Population using basic drinking water service: population using an improved drinking water source/facility with a total collection time of 30 minutes or less for a round-trip, including queuing

41. Population using safely managed drinking water services: population using an improved source of drinking water (improved source of drinking water include: Piped water into dwelling yard or plot, borehole or tube wells, protected dug wells, protected spring, rainwater and packaged or delivered water) which is located on premises, available when needed and free of (faecal and priority chemical) contamination.

42. Population using basic sanitation services: population using an improved sanitation facility (improved Sanitation facilities include: flush/pour flush to piped sewer system, septic tank or latrine; ventilated improved pit latrine, composting toilet or pit latrine with slab) which is not shared with households

43. Population using safely managed sanitation services: population using an improved sanitation facilities (improved sanitation facilities include: flush or pour flush to piped sewer systems; septic tanks or pit latrine; ventilated improved pit latrine; composting toilet or pit latrine with slab) which is not shared with other household and where excreta are treated and disposed in situ or transported and treated offsite

44. Meteorological: Related to the weather or changes in the Earth's atmosphere.

45. Hydrographical: is the branch of applied sciences which deals with the measurement and description of the physical features of oceans, seas, coastal areas, lakes and rivers, as well as with the prediction of their change over time, for the primary purpose of safety of navigation and in support of all other marine activities.

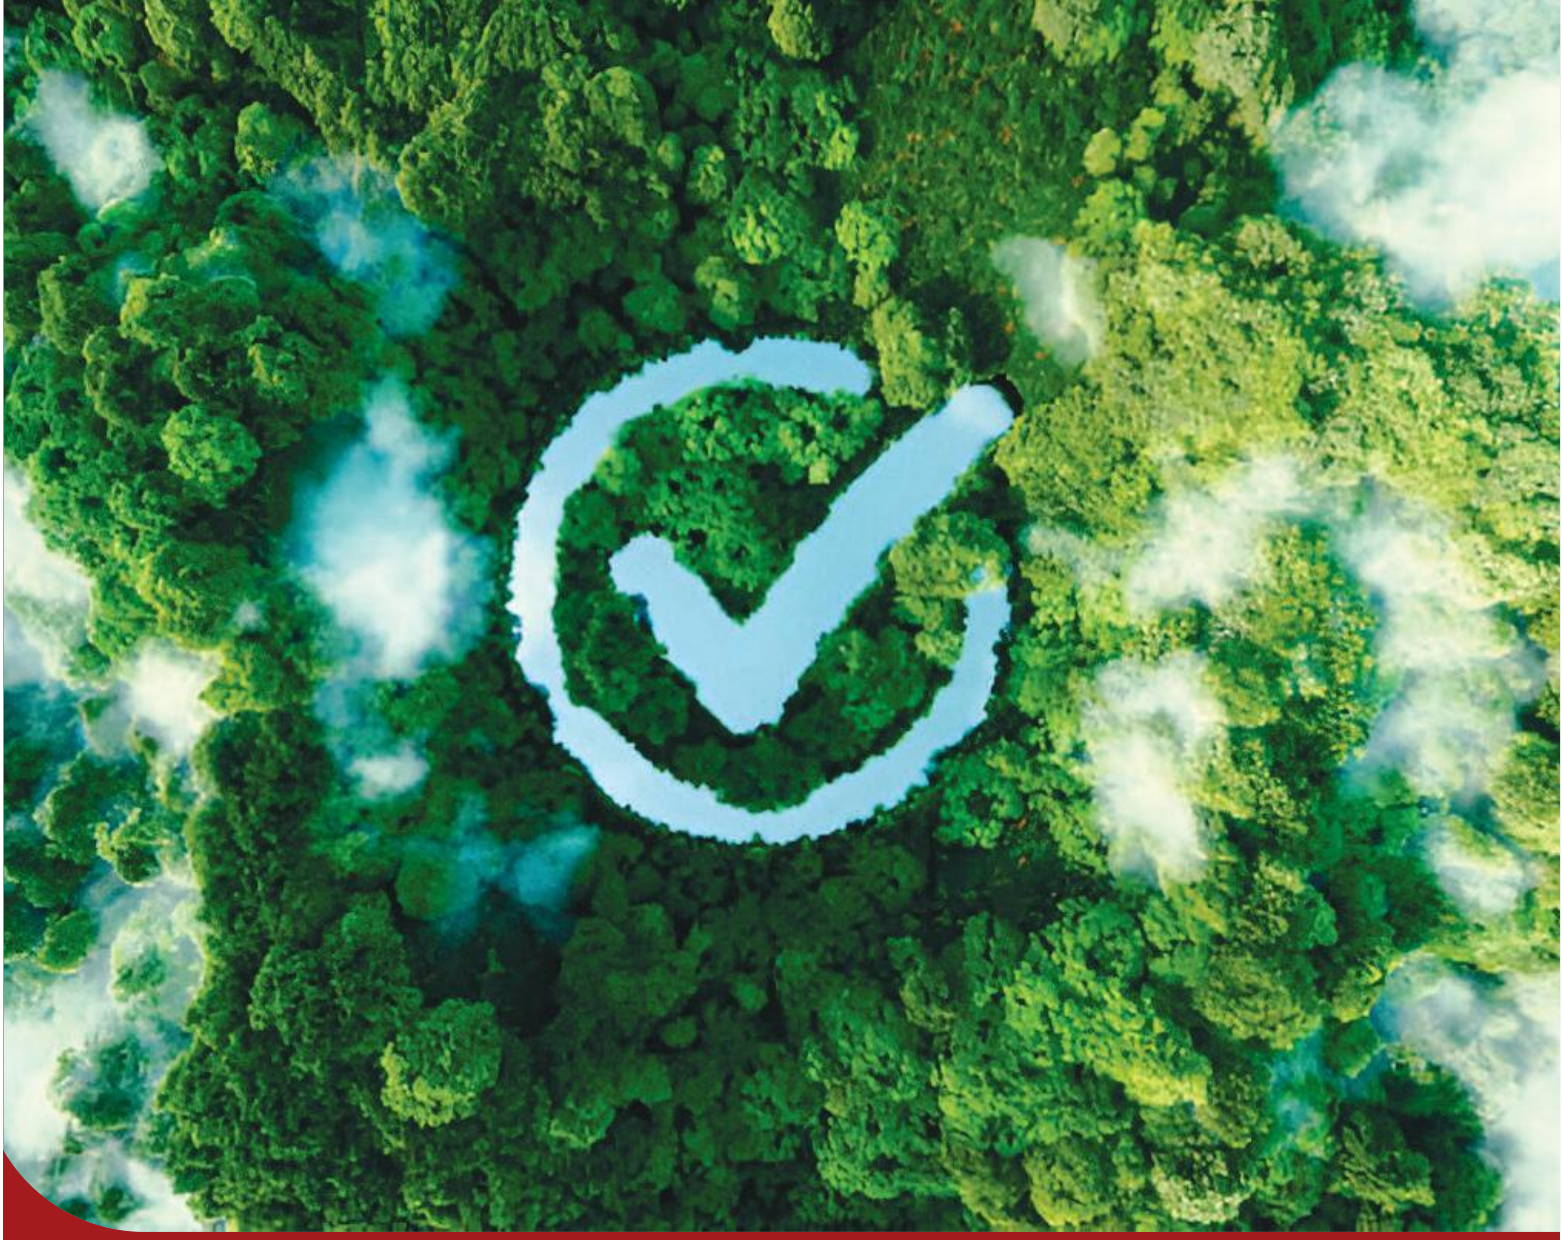
46. Geological: relating to the study of the earth's physical structure and substance

47. Geographical: based on or derived from the physical features of an area

48. Biological: relating to biology or living organisms

49. Inter Tropical Convergence Zone (ITCZ): is a belt of low pressure which circles the Earth generally near the equator where the trade winds of the Northern and Southern Hemispheres come together. It is characterised by convective activity which generates often vigorous thunderstorms over large areas

50. Synoptic Weather Stations: are instruments which collect meteorological information at synoptic time 00h00, 06h00, 12h00, 18h00 (UTC) and at intermediate synoptic hours 03h00, 09h00, 15h00, 21h00 (UTC)



01

ENVIRONMENTAL CONDITIONS AND QUALITY

1.0 Introduction

This chapter covers statistics on the physical, biological and chemical characteristics of the environment and their changes over time. Environmental condition refers to the state of the environment at a given time point. Environmental quality on the other hand refers to a measure of the condition of the environment relative to a requirement or threshold of one or more species or to any human need or purpose.

1.1 Physical Conditions

This sub component aims to capture the physical aspects of the environment and focuses on statistics on the meteorological,hydrograpghical,geological and geograhical conditions and soil characterustics.

1.1.1 Atmosphere, Climate and Weather

This topic covers data on atmospheric, climatic and weather conditions across territories and over time. Weather describes the atmosphere's behavior over a short period of time while climate is determined by long term weather conditions, both of which are recorded through monitoring stations. Information about the atmosphere, climate, and weather is important to understand the conditions and trends to explain other phenomena such as ecosystem change, biodiversity and living conditions, among others.

The climatic regions and their corresponding synomtic weather stations are presented in Table 1.1 namely, North Western, North Eastern, Western, Central Rift Valley, Central, Nairobi, South Eastern and the Coastal strip.

Table 1.1: Climatic Regions and Meteorological Stations Under Each Region

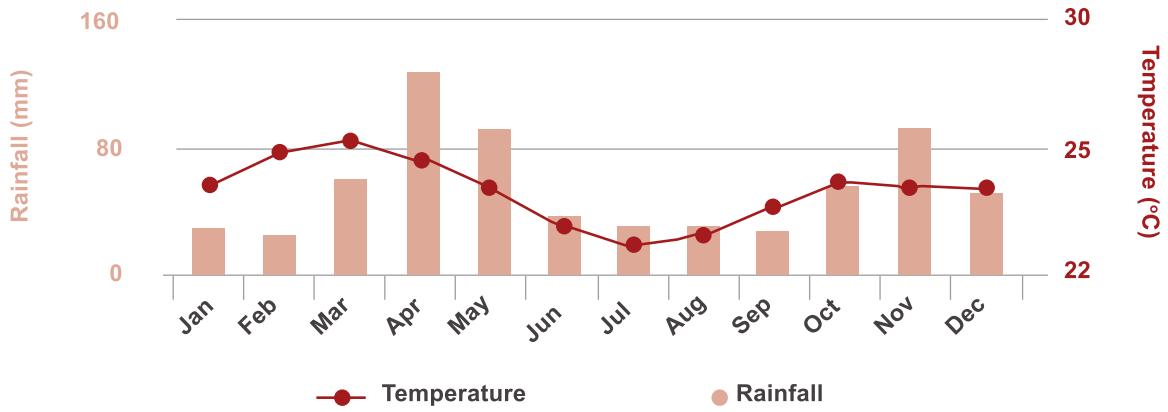
Climate

Kenya has a moderate tropical climate which is tempered by topographic relief, especially mountains such as Mt. Kenya, Aberdare Ranges, Mau Forest Complex, and Mt. Elgon, as well as the movements in the Inter Tropical Convergence Zone (ITCZ).The climate is also affected by large water bodies and the relatively wet and narrow tropical belt along the Indian Ocean as well as the large areas of the Arid and Semi-Arid lands (ASALs). The average monthly temperature and rainfall for Kenya is presented in Figure 1.1. Kenya has two main seasons namely March April May(MAM) and October November December (OND)

Figure 1.1: Average Monthly Temperature and Average Rainfall for Kenya from 1991-2020



Source: *Kenya Meteorological Department*

Rainfall Distribution

As seen in Table 1.2, regions which receive high annual rainfall are Western, Central, Coastal Strip and Central Rift Valley. North Western and North Eastern parts of the country receive the lowest amount of rainfall.

Table 1.2: Annual Rainfall, by Regions, 2012-2023 (mm)

Region	2012	2013	2014	2015	2016	2017	2018	2019	2020	2021	2022	2023	LTM (2012-2023)
North Western	399.0	296.0	139.3	170.0	219.3	226.2	282.7	309.5	380.8	176.5	103.6	248.7	245.9

Source: *Kenya Meteorological Department*

Table 1.3 presents average monthly rainfall in each of the regions. Most areas had April as the month with the highest rainfall. However, while May was the highest rainfall month in the coastal region, November emerged as the highest rainfall month in the case of the South Eastern region. Similarly, whereas January/February were the lowest rainfall months for most regions, July was the lowest rainfall month in the case of Central, Nairobi and the South Eastern regions.

Table 1.3: Average Monthly Rainfall in (mm) for All Regions, 2010-2023

Temperatures

Temperatures in Kenya's tropical climate vary considerably according to topography; the central highlands are substantially cooler than the coast regions. The surface temperature varies from one area to another and from season to season as illustrated in Table 1.4. The year 2015 and 2017 were the hottest years in Kenya while years 2013 and 2019, were the coolest years with a minimum temperature of 17.0°C over the years.

Table 1.4: Monthly Mean Maximum and Minimum Temperatures (°C), 2013-2023

In general, high maximum temperatures of above 30 degrees Celsius (°C) are recorded over the North Western parts of the country (Lodwar), parts of North Eastern region (Moyale, Marsabit, Garrissa, Wajir and Mandera) and the Coastal strip (Lamu, Malindi, Msabaha, Mtwapa and Mombasa) during the December, January, February season as presented in Table 1.5. The northen and coastal parts of the country have less cloud cover during this season, hence receive maximum insolation which leads to high day time temperatures. The lowest maximum temperatures are recorded over the June, July, August season over the central highlands depicting the influence of high altitudes and low insolation on temperatures.

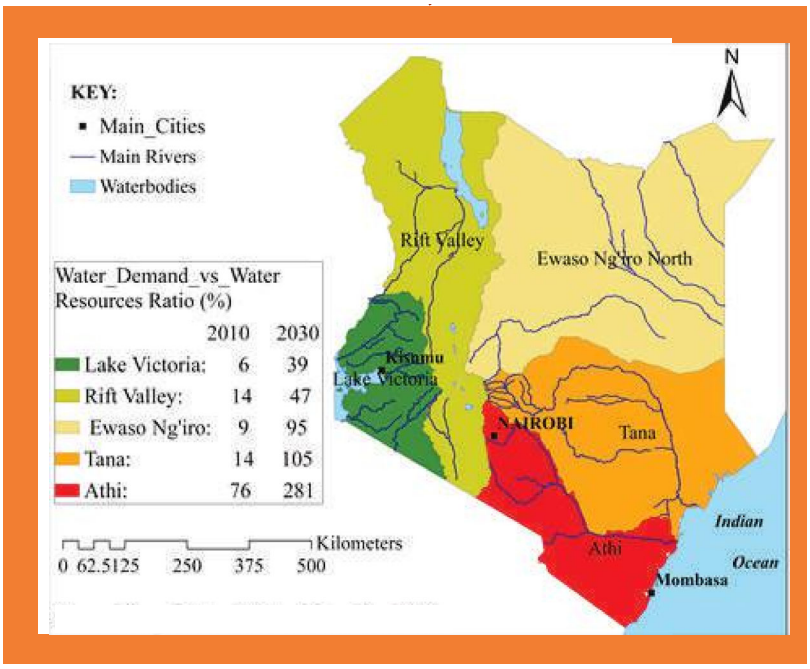
1.1.2. Hydrographical Characteristics

Hydrographical characteristics include information on the location, extent and characteristics of lakes, rivers, and streams, artificial reservoirs, watersheds, seas and aquifers. This information is compiled to serve as basis for understanding water and flows of water.

Water Basins

Kenya has five major water basins: namely; Lake Victoria, Rift Valley, Athi River, Tana River and Ewaso Ngiro basins. However, only two of these basins can be rated to have surplus water resources: Lake Victoria and Tana River as illustrated in Figure 1.8.

Figure 1.8: Water Basins and Water Balance in Kenya



Source: *Kenya National Water Master Plan 2030*

Watersheds

The main five watershed in the country are the: Aberdare mountain, the Mau forest complex, the Mount Kenya, the Mount Elgon and the Cherengani hills.

Aberdare Mountain Watershed. The Aberdare mountains are an isolated volcanic range that forms the easternmost wall of the Great Rift Valley, to the east of the high Kinangop/Laikipia plateau. They are around 100 km long from north to south (the northern end almost reaching the equator). Mist and rain occur throughout much of the year, with precipitation varying from around 1,000 mm on the drier north-western slopes to as much as 3,000 mm in the south-east. The major rivers from Aberdare Forest are Athi and Tana, which flow into the India Ocean, Ewaso Nyiro that drains into the Lorian Swamp and River Malewa that drains into Lake Naivasha. The ranges also have several tributaries, and higher up are bog markings that are the source of the rivers on the moorlands and afro-alpine. The Athi, Lake Naivasha, Tana and Ewaso Nyiro river basins have their source in Aberdare Forest Reserve.

Mau Forest Watershed. Mau Forest is a forest complex in the Rift Valley of Kenya. It is the largest indigenous montane forest in East Africa. The Mau Forest complex has an area of 273,300 hectares (675,000 acres). The forest area has some of the highest rainfall rates in Kenya. Mau Forest is the largest drainage basin in Kenya. Numerous rivers originate from the forest, including Southern Ewaso Ng'iro, Sondu River, Mara River and Njoro River. These rivers feed Lake Victoria, Lake Nakuru and Lake Natron. Western slopes of the Mau Escarpment are covered by Mau Forest.

Mount Kenya Watershed. Mount Kenya is the highest mountain in Kenya and the second-highest in Africa, after Kilimanjaro. The highest peaks of the mountain are Batian (5,199 metres (17,057 ft)), Nelion (5,188 metres (17,021 ft)) and Point Lenana (4,985 metres (16,355 ft)). Mount Kenya is located in the former Eastern and central provinces of Kenya, , about 16.5 kilometres (10.3 mi) south of the equator, around 150 kilometres (93 mi) north-northeast of the capital Nairobi. The forested slopes are an important source of water for much of Kenya.

Mount Elgon Watershed. Mount Elgon National Park is a national park 140 kilometres (87 mi) northeast of **Lake Victoria.** The park covers an area of 1,279 sq km (494 sq mi) and is bisected by the border of Kenya and Uganda. The Ugandan part of the park covers 1,110 sq km (430 sq mi) while the Kenyan part covers 169 sq km (65 sq mi). Mount Elgon is an important water catchment for the Nzoia River, which flows to Lake Victoria, and for the Turkwel River which flows into Lake Turkana.The climate is moist to moderate dry. Annual rainfall is over 1,270 millimetres.

Cherangani Hills Forest Watershed. Cherangani Hills Forest is a collection of thirteen forest reserve blocks in western Kenya, located in the Cherangani Hills on the western ridge of the East African Rift. The forested area is about 1,200 sq km (463 sq mi), 956 sq km (369 sq mi) of which has been gazetted into forest reserves. These forest reserves form the upper catchments of the Kerio and Nzoia and Turkwel rivers.

Status of Lakes Victoria and Turkana Water Levels

Following the heavy rainfall experienced in Kenya and the region over the last two seasons (October to December and March to May), Lake Victoria as well as Rift valley Lakes (i.e Turkana, Nakuru, Naivasha, Baringo among others) recorded very high levels and have remained high for several months. The lakes have thus continued to inundate the shoreline areas and displacing many people.

1. Lake Victoria

Lake Victoria is the world's second largest lake and the largest in the developing world. It covers an area of 68,800 sq km, spanning 400 km north-south and 240 km east-west. The lake is shared by Kenya, Tanzania and Uganda with only 6% of the surface area of the lake within the Kenyan territory, while Tanzania and Uganda have 51% and 43% respectively. The depths range from an average of only 40m, and a maximum depth of 79m in the open lake. The main rivers which originate from Kenya and feed the lake include Nzoia, Yala, Nyando, Sondu, Mara and Gucha Migori plus the shoreline streams. These contribute 42% of the total river discharge entering Lake Victoria from land catchment. Consequently activities in Kenya catchments potentially affect a substantial portion of the river discharge to the lake and especially in Winam Gulf.

The Kenyan side of the lake encompasses the Rusinga channel and Winam gulf which is relatively shallow (0-5m). The lake's aquatic environment represents a considerable part of the economic potential of the lake region with regard to fisheries and navigation and a source of livelihood to riparian communities.

Analysis of Rise in Lake Victoria Levels

Data from the monitoring station at Kisumu port indicate that Lake Victoria level has been steadily rising from October 2019. The lake level has risen by more than 1.4m (vertical height) in the last 7 months. As a result, the Lake has reclaimed the riparian land submerging settlement and farms within the contour buffer. This has also caused an increased back water flow causing floods at the river mouths of Nzoia, Yala, Nyando, Sondu and Gucha Migori displacing communities and inundating homes and farms. Because of the shallow depths of Winam gulf, a small vertical gain translates to a larger horizontal inundation, hence communities around the lake have been advised to move to higher grounds away from the lake shores as rains continue at the catchments and over the lake. The most affected areas include shorelines around Kisumu and Homabay Counties, Islands such as Remba, Takawiri and Ringiti among others.

The lake level data from monitoring station is corroborated by the analysis of relative lake height variations computed from satellite altimetry data sets based on satellite data series showing that lake Victoria levels have risen beyond the highest recorded values in recent years.

2. Lake Turkana

Lake Turkana is located within Kenya's northern arid and semi-arid lands. The area is prone to frequent droughts during which livestock perish in large numbers. The Lake Turkana catchment area is 130,860 sq km both in Kenya and Ethiopia. The lake is Africa's fourth largest lake, and the world's largest desert lake. The lake is located in Kenya within an area inhabited by predominantly pastoralist community.

The lake is sustained by the inflows of Ethiopia's Omo River, which alone provides 90% of the lake inflow. Lake Turkana is a closed basin, hence the inflows are totally evaporated over time, and hence the lake waters are almost saline, unfit for consumption, and unsuitable for agriculture. However the lake has a thriving and diverse fish population. Other rivers draining the lake from Kenya include Kerio and Turkwel.

The Omo River which discharges into the northern end of Lake Turkana river has formed a delta, which has expanded and encroached further south into the lake in recent years. The delta expansion is perhaps partly a consequence of increased sediment runoff and higher floods arising from escalation of human activities in the Omo Basin, plus lake recession exposing formerly inundated areas.

Analysis of Lake Turkana Levels

The lake levels have been monitored at Fergusons Gulf on the Kenyan side. There are no monitoring stations on the Ethiopian side of the delta. Analysis show that the levels have been fluctuating over the years. The Ferguson's Gulf dried out completely in 1986. However, the annual flood in River Omo resulted in a rise in lake level of approximately 0.5m during the same year but this was not sufficient to compensate for the loss by evaporation of 2.3m on an annual basis. The lake level has been falling steadily since the beginning of 2015, this recession period being coincident with the filling of Gibe III dam's reservoir on the Omo River. However, there has been a steady rise since the end of 2017 in response to localised storm-water runoff from catchments near the lake.

Following the heavy rainfall experienced in Lake Turkana catchment both in Kenya and Ethiopia over the last few months , the lake has recorded very high levels and have remained high for several months, inundating the shoreline areas on Kenyan side and displacing the fisher folk.

Data from the monitoring station at Kisumu port indicate that Lake Victoria level has been steadily rising from October 2019. The lake level has risen by more than 1.4m (vertical height) in the last 7 months.

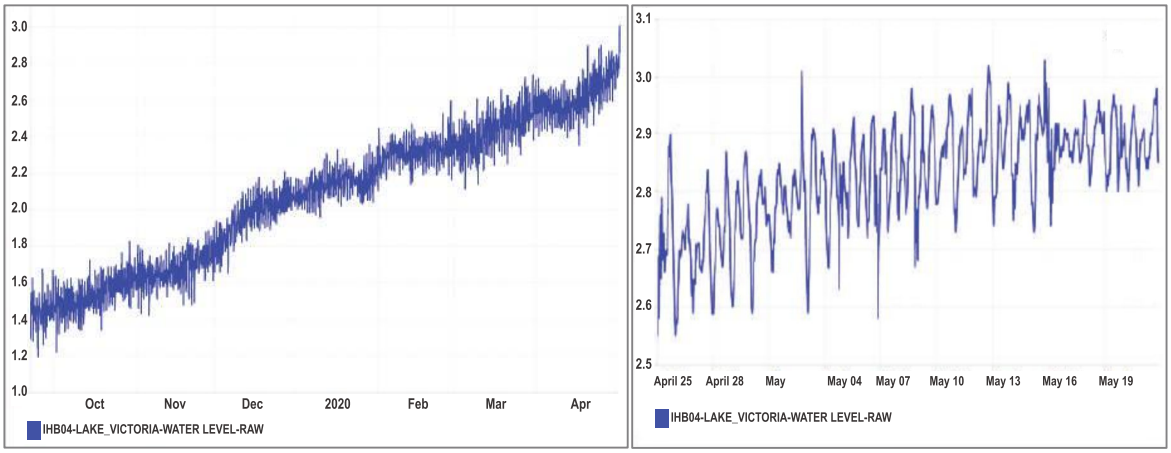
2.0. Analysis of Lake Victoria level Fluctuation

Lake Victoria levels at Kisumu Port RGS 1HB04. The data is recorded on hourly basis and transmitted to Water Resources Authority server every three hours. A rise of about 1.4m has been observed between October 2019 and May 2020.

Figure 1.11: Lake Victoria Water Levels



Source: *Water Resources Authority*

Relative lake height variations computed from satellite altimetry data sets show that both lake Victoria and Turkana levels have risen tremendously in the last few months.The data is based on the TOPEX/Poseidon/Jason satellite series, the ERS/ENVISAT/SARAL satellite series and the Sentinel-3 satellite series. The graphs are results from a smoothing/filtering function that aims to reduce outliers and reduce high frequency noise.

Lakes, Mountains; and National Parks

Kenya has a large number of freshwater and saltwater lakes with a total area of about 10,839 sq km as shown in Table 1.7. Lake Turkana is the largest lake in the country with a surface area of 6,405 sq km followed by lake Victoria. Lake Nakuru, Bogoria and Elementaita are the most important salt water lakes in the country for their environmental and historic richness. The lakes are not only salty, but are also home to about 75 per cent of the world's population of flamingos. The area surrounding these lakes is home to hundreds of bird species and have all been declared Ramsar sites. Major mountains include; Aberdare Ranges, Mount Kenya, Mau Escarpment, Mount Elgon and Cherangani Hills. Mount Kenya is the tallest mountain followed by Mount Elgon.

1.1.3. Geological and Geographical Features

Geological and geographical information involves general geological and topographic information along with the characteristics of the country's territory and relief. This information is normally static, that is, it changes very slowly through time. It is helpful to present these statistics in a form of a map. Data for geological and geographical information are helpful to know the agreement on boundaries and understand geological events.

The geography of Kenya is diverse, with relief, climatic and ecological extremes affected by altitudes, which vary from sea level to over 5,199 M.A.S.L. on Mt. Kenya, the highest mountain in the country. The terrain ranges from coastal reefs to inland plains, plateaus, with dominant features being major highlands which constitute the "Water Towers" of the country.

Kenya lies in Eastern Africa, straddling the equator, between latitudes 4o N and 4o S, and longitudes 34o E and 41o E; .Kenya shares borders with Uganda to the west, Tanzania to the south, Ethiopia in the north, South Sudan in the north-west, Somalia in the east and the Indian Ocean to the southeast. This strategic position accords Kenya an important influence as a regional and economic hub for East Africa.

The country has land boundaries totaling 3,457 km and has the following border length: Ethiopia (867 km), Somalia (684 km), South Sudan(317 km), Tanzania (775 km) and Uganda (814 km).

The Kenyan coastline is about 600 km in length with an estimated continental shelf area of about 19,210 Sq. km. The Coastline runs from the Tanzania boarder in the south to the Somalia boarder in the north between latitudes 1°40'S and 4°25'S and longitudes 41°34'E and 39°17'E. Kenya's territorial sea and Exclusive Economic Zone (EEZ) extend 12 nautical miles (nm) and 200 nm respectively. The coastal region stretches roughly 150 km from the seafront, covering an area of 67,500 Sq. km.

Table 1.8 shows the total area of the country and by counties. The surface area is about 610,000 Sq. km comprising of land area (580,609 Sq. km.), water area (11,362 Sq. km.) and terrestrial water area (18,029 Sq. km.). The largest counties in size are Marsabit, Turkana, Wajir, Garrissa, Tana River, Isiolo and Kitui while the smallest ones are Mombasa, Vihiga, Nairobi, Nyamira, Kirinyaga, Kisii, and Busia.

3,457 km

The country has land boundaries totaling 3,457 km and has the following border length: Ethiopia (867 km), Somalia (684 km), South Sudan(317 km), Tanzania (775 km) and Uganda (814 km).

600 km

The Kenyan coastline is about 600 km in length with an estimated continental shelf area of about 19,210 Sq. km.

12 nm

Kenya's territorial sea and Exclusive Economic Zone (EEZ) extend 12 nautical miles (nm) and 200 nm respectively.

610,000 sq.km

1.2. Land Cover, Ecosystems and Biodiversity

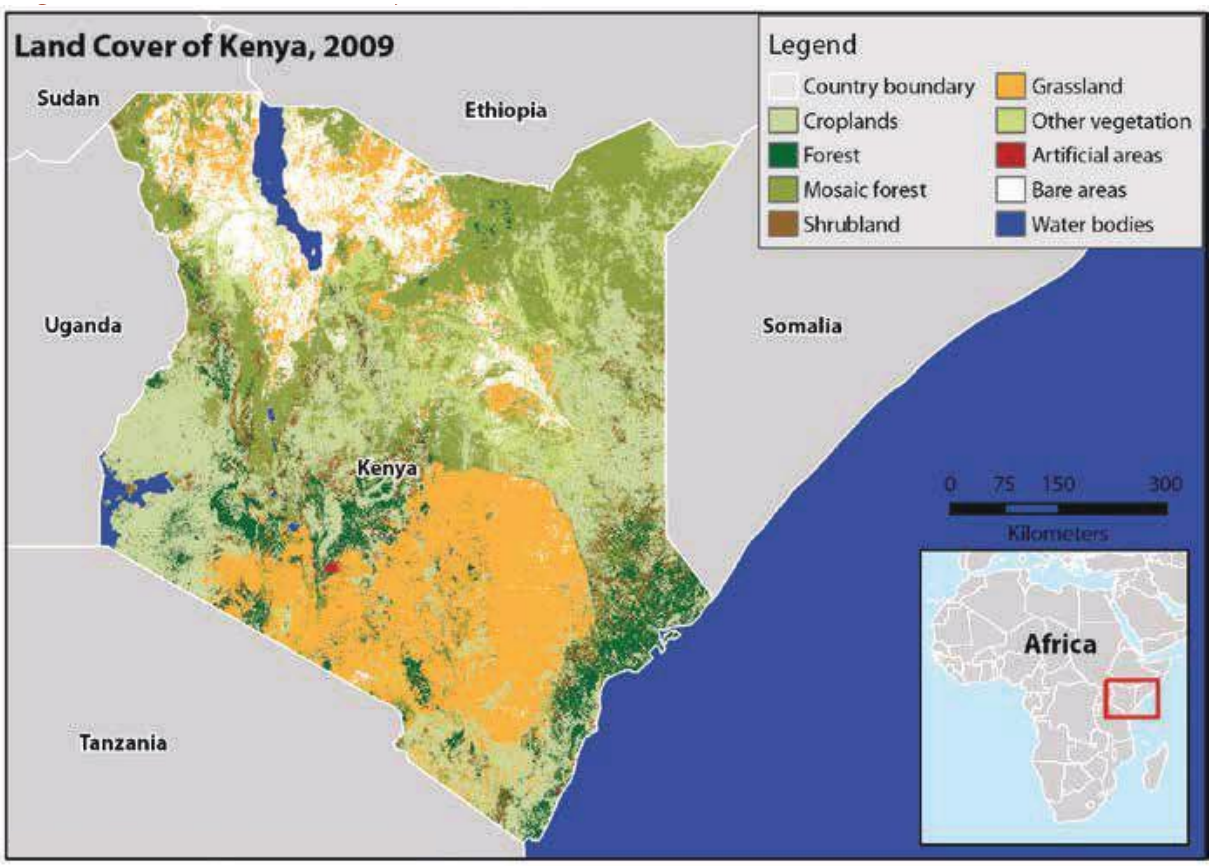
This subcomponent organizes the interrelated environment statistics on land cover, ecosystems and biodiversity, as well as their recordable changes over time and across locations. Land cover, as defined by the Food and Agriculture Organization (FAO), is the observed (bio)physical cover of the earth's surface. It is one of the indicators of ecosystem type. Biodiversity, a measure of ecosystem health, is the variability among living organisms from all sources including terrestrial, marine and other aquatic ecosystems and the ecological complexes.

1.2.1. Land Cover

Statistics on land cover include the land area and the area under inland water, coastal water bodies and inter-tidal areas, excluding marine water. It is important to compile

data on land cover because human activities are the main drivers in the change of land cover. Information on land cover is generated by interpreting satellite images in a given period of time. For the 2015 Land Cover Statistics, the Kenya Forest Service (KFS) used the FAO 2009 International Standard as basis in land cover classification, which is aggregated into 9 categories– Cropland, Forest, Mosaic forest, Shrubslands, Grassland, Sother vegetation, Artificial areas,Bare areas and water bodies as shown in Figure 1.14.

Figure 1.14 :Land Cover of Kenya



Source: *FAO/ ESA GlobCover 2009, ESA 2010 and UCLouvain*

In Kenya, land cover is classified into six broad classifications namely; forestlands, croplands, grassland, settlements, wetlands and other lands as shown in Table 1.9. As of 2020, Kenya had 40.0 million hectares of grassland (68.9 percent), which is the largest share in the country's total land cover area. Cropland has about 11.1 million hectares of land which is 19.1 per cent of the total land area.

40.0 million

As of 2020, Kenya had 40.0 million hectares of grassland (68.9 percent), which is the largest share in the country's total land cover area.

Table 1.9: Trend in Land -Cover / Use Changes in Kenya, 1990-2018

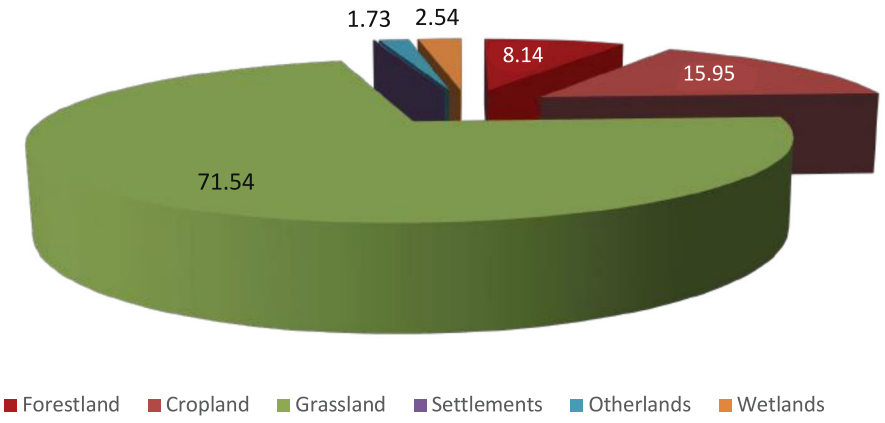
Figure1.15:Trend in Land Cover, 2018



Source: *Kenya Forest Service*

Land Cover as Habitat for Biological Diversity

The land cover as habitat for biological diversity was categorized into 10 classes by the Directorate of Resource surveys and Remote Sensing (DRSRS). These were primarily from remote sensing perspective and the classes include: Dense Forest (above 65 per cent canopy cover), Moderate Forest (40 per cent to 65 per cent canopy cover), Open Forest (15 per cent to 40 per cent canopy cover), Annual Crops, Perennial Crops, Open Grasses, Wooded grass, Water body, Vegetated Wetland and Otherland. Landsat Satellite Imageries (spatial resolution 30m) were used by DRSRS to generate the land cover data. For the purpose of this work, data at 4 year interval covering 2002, 2006,2010,2014, and 2018 was used to generate land cover maps to

1.2.1. Biodiversity and Ecosystem

Statistics related to ecosystems and biodiversity are critical given the increasing understanding of the role ecosystems play in human well-being and the evidence of biodiversity loss across the planet. Maintaining biodiversity and ecosystem health is necessary to preserve the genetic and ecosystem inheritance of a country, as well as its ecological productivity.

Threatened Species

Table 1.10: Number of Threatened Species in Each Major Group of Organisms, 2023

Indicator	Mammals	Birds	Reptiles	Amphibians	Fishes	Molluscs	Other Inverterbrates	Plants	Fungi & protists	Total
Number of Threatened Species	27	42	11	11	72	19	67	230	0	479

Source: *KWS, IUCN and BirdLife International*

Note

** Reptiles, fishes, molluscs, other invertebrates, plants, fungi & protists: please note that for these groups, there are still many species that have not yet been assessed for the IUCN Red List and therefore their status is not known (i.e., these groups have not yet been completely assessed). Therefore, the figures presented below for these groups should be interpreted as the number of species known to be threatened within those species that have been assessed to date, and not as the overall total number of threatened species for each group.*

Table 1.11: Number of Animals in Each Red List Category, 2023

Indicator	EX	EW	Subtotal	CR	EN	VU	sub total	NT	LR/cd	DD	LC	TOTAL

In Kenya, the flora and fauna are diverse, due to the variation in altitude, rainfall and temperature. The country has one of the highest gene pools with some species being either endemic,rare,, threatened or vulnerable. It is estimated that there are over 35,000 species of known flora and fauna species as illustrated in Table 1.13. The number of known flora (plants) species stood at 7004 while those of fauna(animal) species were 28,334. However, many species still remain unknown and possibly not even discovered.

Threat Categorization and Listing of Species

The number of threatened species in each major group of is depicted in Table 1.14. Of the 245 species listed in Schedule 6 of Wildlife Conservation and Management Act, 2013, 19 are critically endangered, 45 endangered, 73 vulnerable, 30 near threatened, 3 threatened and 75 are protected.

Of these groups, seven mammals, two birds, seven fish, one insect, one frog and one turtle are critically endangered.

Mammals: Out of the seven mammals that are critically endangered, the black rhino with year 2017 population of **746** has shown increasing population trends. The black rhino is distributed in **10** National Parks, **1** National Reserve, and **7** Community Conservancies.

Birds: The two critically endangered bird species- the Taita Apalis **(200-400 individuals)** and Taita Thrush are facing severe decline in numbers due to the destruction of their habitats and land use change especially in Taita Hills.

Fish: The six fish species are listed as critically endangered four of which are tilapia **(2 in Lake Jipe, 1 in Lake Challa and 1 in Lake Victoria)**. The decline in Victoria Tilapia is attributed to the invasive Nile Perch which was introduced in the lake for commercial purposes in 1957. The other two critically endangered fish species are Rainbow Sheller and deep water Cat fish whose decline is attributed to the invasive Nile Perch predation in Lake Victoria.

Insects: Only one insect, the Montane Dancing Jewel, is listed as critically endangered. This species is found in the riverine forest around the Aberdares and is declining due to loss of its area of occupation.

Frog: The Du Toit's Torrent Frog which is endemic to Mt. Elgon is one of the amphibian listed as critically endangered. The species was last sighted in 1962 and is suspected to have been affected by infectious fungal disease chytridiomycosis.

Turtle: The Hawksbill turtle is the only marine species listed as critically endangered. Its survival is threatened by a host of factors ranging from climate change (affecting sex ratio) to habitat intrusion and over exploitation for both meat and eggs.

Table 1.14: List of Endangered Species in Kenya, 2023

Source: *Kenya wildlife Service*

- CE-critically endangered, EN-endangered, VN-vulnerable-NT-near threatened, T-threatened, Protected

- According to the 7th Schedule of Wildlife Act 2013, the Invasive species are; 1 mammal- coypu found in Lake Naivasha,7 reptiles,17 Birds,10 plants,1 Invertebrates (crown of Thorn). The Nile Perch and Parthenium hysterophorus are not listed.

- Species protection involves conserving the variety of animal and plant species and stopping the loss of biological diversity.

Notes

- Critically endangered (CR) - Extremely high risk of extinction in the wild

- Endangered (EN)---------- High Risk of extinction in the wild

- Not Evaluated (NE)---------Has not yet been evaluated against the criteria

- Extinct (EX)----------No Known individuals remaining

- Extinct in the wil (EW)-----Known only to survive in captivity, or as a naturalized

Population outside its historic range

- Vulnerable (VU)----------High risk of endangerment in the wild

- Near Threatened (NT)-----Likely to become endangered in the near future

- Least concern (LC)--------Lowest risk. Does not qualify for a higher risk category.

- Widespread and abundant taxa are included in this category

- Data Deficient (DD)--Not enough data to make an assessment of its risk of extinction

Protected Areas

A protected area is any portion of land or water that has been outlined as officially controlled privately or by the state with a view to preserve the natural environment and its services such as biodiversity conservation. Land designated as protected areas, include; forests, national parks, national reserves, conservancies, ramsar sites, biosphere reserves and world heritage sites. The number of protected areas in 2022 were 411 covering 13.16 per cent of the total land area. As illustrated in Table 1.15, terrestrial and marine protected areas cover 12.4 per cent and 0.8 per cent of the total area in Kenya, respectively.

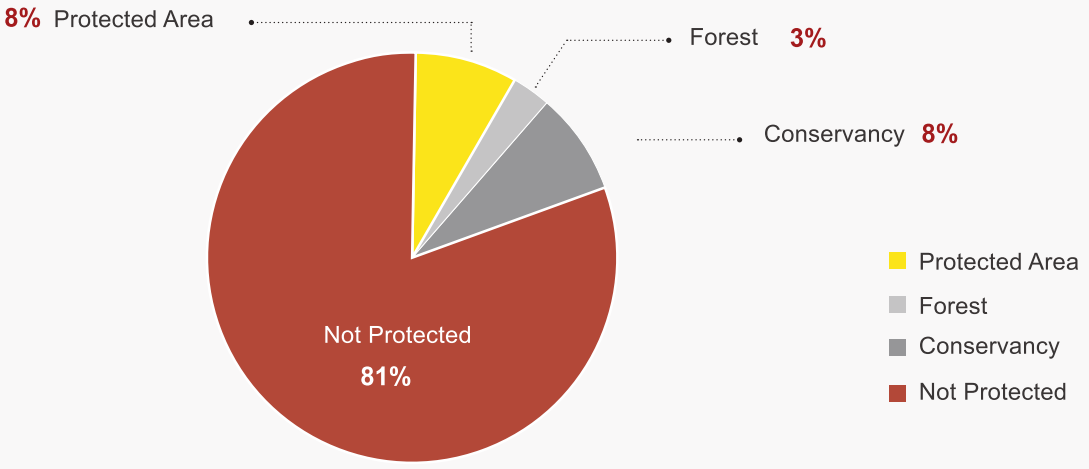
Table 1.15: Protected Terrestrial and Marine Areas as of 2023

Category of area	Unit	Total area
Number of protected areas in Kenya	No.	411
Total terrestrial area	Km^2	586,770
Land Area protected	Km^2	72,544
Percentage area protected	%	12
Total marine area	Km^2	112,400
Marine area protected	Km^2	904
Percentage area protected	%	1

Source: *National Museums of Kenya 2022*

The protected area in Kenya is 8.0 per cent of the total land area. The forest protected area is about 3 per cent whereas area under conservancies is 8 per cent. The total area of land under no protection is 81 per cent.

Figure 1.17: Protected Area as a Percent of Total Land Area



Source: *National Museums of Kenya*

Terrestrial Parks- 24 (distributed in 17 counties) covering 29,504 sq km (5.08% of Kenya). Marine Parks: Malindi (6 sq km), Watamu (10 sq km), Mombasa 26.093 sq km), Kisite (28 sq km).

Terrestrials Reserves- 31 (distributed in 21 counties) covering 17.358 sq km (3% 0f Kenya). Are managed by counties except 4 which are managed by KWS.

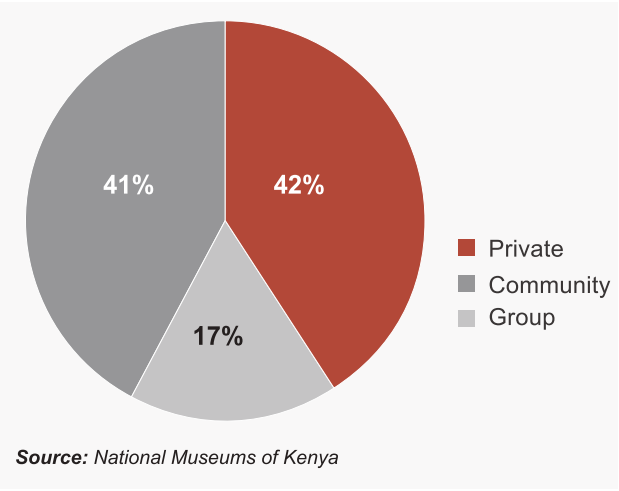
Marine Reserves. Malindi (213 sq km), Watamu (32 sq km), Mombasa (200 sq km), Mpunguti (11 sq km), Kiunga (250 sq km), Diani Chale (165 sq km).

Forest Reserves- 257 sites registered as natural forests:52 as community forests (180245 ha), 201 as Forest reserves (2,045,406ha),3 as national monuments (401ha),1 trustland (188,207ha).

Conservancies. There are 164 conservancies in the country covering an area of 63,600 sq km. 4 are marine,76 are community,58 are private, and 26 are group.

Of the 164 conservancies in the country 60 are listed under the world Database protected Area (WPDA). The largest conservancy in the country is Melako (5467 sq km)in Marsabit County , followed by Malkahalaku (4800 sq km) in Tana River County and then lokichar (4540 sq km) in Turkana County.

Figure 1.18: Conservancy Types



Source: *National Museums of Kenya*

Terrestrial and marine protected areas as a share of total territorial area. The number of protected areas in Kenya is 411. Protected areas embrace various types of ecosystems namely: forests, wetlands, savannah, marine, arid and semi-arid and comprise of 23 terrestrial National Parks, 28 terrestrial National Reserves, 4 marine National Parks, 6 marine National Reserves and 4 national sanctuaries. Kenya terrestrial and marine protected areas as a share of total territorial area was 13.16 per cent in 2017.

Marine protected areas as a share of territorial waters. Marine protected areas are areas of intertidal or subtidal terrain--and overlying water and associated flora and fauna and historical and cultural features--that have been reserved by law or other effective means to protect part or all of the enclosed environment. Kenya marine protected areas as a share of territorial waters 0.8 per cent in 2017.

Ramsar sites. A Ramsar site is a wetland site designated to be of international importance under the Ramsar Convention. The Convention on Wetlands, known as the Ramsar Convention, is an intergovernmental environmental treaty established in 1971 by UNESCO, which came into force in 1975. The convention entered into force in Kenya on 5 October 1990. Kenya currently has 6 sites designated as Wetlands of International Importance (Ramsar Sites), with a surface area of 265,449 hectares.

Table 1.16: Ramsar Sites

Ramsar site	Year established	Area (ha)	Importance
Lake Nakuru	1990	18,880	lesser flamingo
Lake Naivasha	1995	30,000	Red Knobbed Coot
Lake Bogoria	2001	10,700	lesser flamingoes (over 1 million)
Lake Baringo	2002	31,469	oreochromis niloticus baringoensis is endemic
Lake Elementaita	2005	10,880	has 28.5% of the worlds lesser flamingoes
Tana River Delta	2012	163,600	second important estualine & deltaic ecosytems

Source: *NEMA*

Important Bird Areas. In addition to the ramsar there are 63 Importance Birds Areas in Kenya.

Biodiversity Hotspots in Kenya. There are 25 global hotspots in the world 5 of which are found in Kenya. Shimba Hills- Holds more than half of Kenya's rare trees. Three Sisters Cave Complex (15 Km north of Shimoni)- Pangani, Kisimani and Midenyenye- sacred site of the Kaya. It is a non gazetted forest with about 121 species of threatened species (1.9 per cent of Kenya's 6500 flora) and 46 fauna (8.1 per cent of the 1500 species)

Arabuko Sokoke/ Boni- Dodori- last stronghold globally for the critically endangered Aders Duiker. Mt. Kenya- Afro-alpine species that are endemic to Kenya (area covered is about 715 sq km). Mt. Elgon- the forest ecosystem (107821ha)- 22 mammals, 2 insects and 13 bird species of which 9 are endemic

The Nagoya Protocol. It was signed on October 29th of 2010 and entered into force on 12th October 2014. It has been ratified by 112 parties including 111 UN members states and the European Union. Kenya ratified it on 1st of May, 2014.

Elephant Ivory and Rhinoceros Horns.

The total weight of the ivory stockpile held in the country as of 27th August 2017 was 55,883.30 Kg and 419.29 kg for the Rhino horns as shown in Table 1.18. As a symbol of the country's fight against poaching and rendering the stock piles beyond economic use the country destroys elephant ivory and rhino horns through burning.

Wildlife Population Estimates in the Rangelands

The rangelands of Kenya are critically important for wildlife conservation. Aerial surveys of wildlife in the rangelands have been conducted and these data analysed to determine population trends for the period 2010 to 2023 as shown in Table 1.19 . All wildlife species except Buffalo. Burchels Zebra and elephant showed a decline during the 2010-2019 period. H. Hartbeest and Topi declined by more than half during the same period.

Table 1.19a: Wildlife Population Estimates in the Rangelands '000 Number

Forests

Forest is a land area of more than 0.5 ha, crown cover of 10 per centy, trees of at least 2.5 m height, which is not primarily under agriculture or another specific non-forestland use. Increased forest cover is one of the Kenya vision 2030. The goal is to increase area under forest to 10 % and sustainably manage natural forest resources for environmental protection and enhanced economic growth.

Distribution and Trends of Forests in Kenya

Deforestation and forest degradation continue to pose significant challenges driven by among others pressure for conversion to agriculture, urbanization and other developments, unsustainable utilization of forest resources, inadequate forest governance and forest fires. The country has been experiencing sharp decline in forest cover and canopy distribution between 2002 -2006 and 2010-2014 as indicated in Table 1.20. With accelerated corrective efforts however, the trend has been changing between 2018- 2023. Worth mentioning also is the fact that the technology deployed for 2021 National forest resource assessment involved high resolution imagery. This is unlike the previous assessments where the assessments were based on low to medium resolution imagery.

Forest is a land area of more than 0.5 ha, crown cover of 10 per centy, trees of at least 2.5 m height, which is not primarily under agriculture or another specific non-forestland use.

Stratification of Forests

The forests are further stratified into four strata as shown on the Table 1.21 which have been adopted for assigning emission factors to different forest types. These are, (Dryland forest areas, Montane & Western Rain forest areas and Coastal & Mangrove forest areas) defined by altitude and climate.

A second level stratification on the three strata based on ecozones (Dryland forest areas, Montane & Western Rain forest areas and Coastal & Mangrove forest areas) was done on the basis of canopy closure. The resultant canopy classes are: 15-40 % (Open), 40-65 % (Moderate), and above 65 % (Dense).

Table 1.21: The Resultant Canopy Classes

Land Category	First level stratification	Second level stratification
Forest	Montane/western rainforest/bamboo	Dense (canopy cover ≥65%) Moderate (Canopy cover 40-65%) Open (Canopy cover 15-40%)
	Coastal and Mangrove forests	Dense (canopy cover ≥65%) Moderate (Canopy cover 40-65%) Open (Canopy cover 15-40%)
	Dryland forest	Dense (canopy cover ≥65%) Moderate (Canopy cover 40-65%) Open (Canopy cover 15-40%)
	Plantation forest	Plantation forest
Non forest	Cropland Grassland Wetland Settlement and Other lands

Forest Cover

Mapping was done using satellite images that had the following properties; spatial resolution of 0.5m, Ortho-rectified, WGS 84 datum (EPSG 4326) and RMSE accuracy 3.914m. The satellite images were captured between 2019 to 2021. Forest land was derived from the tree cover by subjecting the classification to the area parameter of forest definition. This was achieved by computing the area of the tree cover blocks (groupings) and later eliminating those with an area of less than 0.5ha. This grouping was irrespective of the tenure system in Kenya.

In line with the current forest resource assessment methodology, there was a departure from the normal segregation of statistics under indigenous mixed trees, Bamboo and Mangrove. An adoption of new grouping based on forest density was been done namely Dense, Moderate and Open Forest & this covers plantations.

Forest resources cover 4.23 million hectares (ha) of the total land area as presented in Table 1.24. Natural forests comprising of indigeneous mixed trees, bambo and mangoves cover 4.03 million ha (95.5 per cent) of the forestland, while plantations forests cover 196.6 thousand hectares comprising of 149.6 thousand hectares of public plantation forests and 47.0 thousand hectares of private plantation forests, respectively.

144.80
Thousand hectares
Total area under state forest plantation increased from 144.0 thousand hectares in 2022 to 144.80 thousand hectares in 2023.

2.4
Thousand hectares
Area planted during period under review was 2.4 thousand hectares, an increase from the 1.2 thousand hectares realized in 2022.

4.23
Million hectares
Forest resources cover 4.23 million hectares (ha) of the total land area

Table 1.24: Forest Cover by Type of Forest ('000 ha)

Category of Forest Type	2017	2018	2019	2020	Forest Canopy Density(2021)	2021	2022	2023

Table 1.27 presents the progress made towards achievements of sustainable forest management in Kenya. Forest area (% of land area) in Kenya was 7.28 per cent in 2018 from 6.96 per cent in 2000 due to good forest management. Annual change rate of total forest cover refers to the average variation in hectares per year calculated over 5, 10 and 15 years of the total forest area. Between 2000 and 2010, Kenya lost an average of 0.91 per cent per year of forest land. This loss declined to a loss of 0.52 per cent between 2010 and 2015. However, between 2015 and 2017 the country gained an average of 0.83 per cent of forest land. Likewise, the proportion of forest area within legally established protected area has also remained at 33.46 per cent while the proportion of forest area under Long Term Forest Management Plan has remained at 4.34 per cent since year 2000

Table 1.27: Indicators of Sustainable Forest Management

	2000	2010	2015	2016	2017	2018
Forest area as proportion of total land area	6.96	6.99	7.16	7.21	7.28	7.28

1.3. Environmental Quality

Environment quality refers to the varied characteristics such as air and water purity or pollution, noise, access to open space and the visual effects of buildings and the potential effects. Environmental quality deals with the concentration of pollutants in the environment which results from combined and cumulative impacts of human and natural processes. Statistics on environmental quality are important in monitoring pollution impacts to human sub-system and ecosystems.

1.3.1. Air Quality

Concentration of air pollutants, suspended solid particles, and other gases are the statistics compiled for this subcomponent. Air quality is measured by monitoring stations which are located mostly near the major sources of pollution. Compilation of these statistics is important to assess the effects of air quality to human and ecosystem health. Kenya like most developing countries, is experiencing high rate of motorization. Currently, transport emissions account for approximately 13 per cent of total national emissions.

Vehicular average carbon dioxide emissions data for selected car models are shown in Table 1.28. High emissions vehicles are the Landrover, lexus and Jaguar at 262.69, 244.72 and 220.29 g/km.

Table 1.28: Average Carbon Dioxide Emissions by Vehicle Fuel Consumption

Vehicle	Average fuel consumption (L/100KM)	Average CO2 emission (g/km)
Lexus	10.36	244.72
Land Rover	10.32	262.69
Jaguar	9.18	220.29
BMW	8.8	215.89

1.3.2. Water Quality

Table 1.29 depicts the Biological Oxygen Demand (BOD) and Chemical Oxygen Demand (COD) of raw effluent by sectors. The higher the BOD value, the greater the amount of organic matter or food available for oxygen consuming bacterias. The COD test is used as an alternative to BOD due to the shorter length of testing time. Sectors with high pollutant discharge load includes the poultry manure, pig sty slurry, industry, cofee pulping, and paper and pulp.

Table 1.29: Pollutant Discharge Load by Sector

Pollution Source	Typical BOD Level of Raw Effluent, mg/l	Typical COD Level of Raw Effluent, mg/l
Industry	1 500 – 22,000	2 000 – 35 000
Coffee Pulping	3 000 – 9 000	3 000 – 28 000
Textile	1 500	3 300
Leather Tanning	1 500	5 000
Paper and Pulp	1 500 -7 000	2 000 – 10 000
Slaughter House	1 400	2 100
Fruit Canning	2 000	3 500 – 6 500
Milk Processing	1 000	1 900
Domestic Waste	500	2 200
Agriculture	8 00 – 1 200	1 000 – 2 000
Cattle Pen washings	1 500	2 000
Pig Sty Slurry	15 000	2 500

Major Rivers Water Quality Status

Major rivers include Tana (800 km), Athi/Galana/Sabaki (530 km), Ewaso-Ngiro-North (520 km), Kerio (350 km), Suam-Turkwel (350 km), Mara (280 km), Nzoia (240 km), Voi (200 km), Yala (170 km), Ewaso-Ngiro-South (140 km), Sondu (105 km), Malewa (105 km) and Kuja (80 km).

The maximum,minimum and average (mean) values of different water quality river parameters are indicated in the Table 1.30. Values above average (mean) shows a higher pollution level. The mean, maximum and minimum values have been indicated to show the analysis for the years of data collection he average. Since the ambient water standards have not been developed, no values can be used to conclude if the water quality parameters are below or above permissible levels.

Table 1.30: The Maximum and Minimum Values of Different Water Quality Parameters

Malewa River.The range value for Dissolves oxygen which a pollution indicator parameter was 5.35 – 6.92 and and a PH of 5.9 – 8.8 for Malewa river.

The Baricho monitoring point is at the delta zone of Athi river as it enters the Indian ocean. The PH recorded is really high at 9.3 with a conductivity of 2033µS this an indicator of high dissolved solid which are making the water more alkaline, which are contributed by sea water flow backs to the river. The nitrates and the conductivity recorded very high with the three years of analysis, though the PH was within the expected range of 7.2-8.5. The high nutrients maybe associated with runoff from agricultural farms. Generally, the water quality for Ewasogiro is not poor in reference to these parameters.

1.3.3.Conclusion

This first chapter dealt with information on the physical, biological, and chemical characteristics of the environment and their changes over time. Many of these natural conditions change very slowly as a result of natural processes or human influence. Others may show immediate and dramatic effects. The source of the data is usually remote sensing and monitoring by environmental, meteorological, hydrological, geological, and geographical authorities or institutions for example the Water Resources Authority, the National Environment Management Authority,Kenya forest service, Directorate of Resource Surveys and Remote Sensing, Kenya Wildlife Service and the Kenya Meteorological Department. The second chapter will gather statiitsics on environmental resources and their use.

02

ENVIRONMENTAL RESOURCES AND USE

2.0. Introduction

Environmental resources and their use, groups statistics related to the availability and use of environmental resources. Environmental resources and their use focus on measuring stocks and changes in stocks of these resources and their use for production and consumption. They include natural resources, such as subsoil resources (mineral and energy), biological resources and water resources, and land.

2.1. Mineral Resources

Mineral resources represent a unique type of environmental asset which can be extracted and used in economic activity but cannot be renewed on any human time scale. There is therefore particular interest in understanding the rate at which these assets are extracted and depleted, the overall availability of these assets, and the sustainability of the industries that exploit them.

Kenya has various mineral resources on the surface and in the subsoil. These include metallic minerals such as gold, titanium and iron ore.; gemstones such as ruby, garnet and sapphire; industrial minerals such as kaolin, soda ash, phosphate, lime, gypsum, diatomite, bentonite, vermiculite, salt and beach sand; building materials such as stone aggregates and sand; and energy minerals such as coal.

2.1.1. Mineral Occurrences

Kenya remains a green field with much of its mineral stock potential unquantified; however, registered mineral occurrences are in the following locations as illustrated in Table 2.1 and Figure 2.1. Table 2.2 further depicts the occurence, stocks and value of key minerals in the country.

Table 2.1: Occurrences of Minerals

County	Minerals
Kajiado	Soda Ash, Feldspar, Limestone Gypsum, Gemstones, Marble & Granite(dimension stone)
Uasin Gishu	Carbon Dioxide Gas
Elgeyo Marakwet	Fluorspar
Baringo	Gemstones (Baringo Ruby), Diatomite
Nakuru	Diatomite
Turkana	Gold, Gemstones, Gypsum
West Pokot	Gold, Gemstones, Chromite
Samburu	Gold, Gemstones, Manganese, Chromite, Vermiculite
Narok (Transmara)	Gold
Nandi (Kibigori)	Gold
Kakamega	Gold, Dimension stone
Siaya	Gold, Iron Ore
Migori	Gold, Copper
Homa Bay	Iron Ore, Gold
Kiambu	Carbon Dioxide, Diatomite
Machakos	Gypsum, Pozzolana
Kitui	Coal, Iron Ore, Copper, Gemstones, Limestone, Magnetite
Makueni	Vermiculite, Gemstones
Tharaka Nithi	Iron Ore, Gemstones
Isiolo	Gemstones
Marsabit	Gold, Gemstones, Manganese, Chromite
Taita Taveta	Iron Ore, Gemstones, Manganese, Graphite
Kwale	Gemstones, Heavy Mineral sands (titanium minerals), Silica Sand, Rare Earth Elements, Niobium
Kilifi	Titanium Minerals, Manganese, Barytes, Gypsum, Gemstones
Tana River	Gypsum
Garissa	Gypsum
Mandera	Gypsum

Table 2.2: Key Mineral Stocks

Mineral Name	Occurrence (Where Found)	Estimated Quantity and or Grade	Estimated Value (Ksh)
Precious and Base Metals (Gold, Copper, Zinc)	Migori, Homa-bay, Kisumu, Siaya, Vihiga, Kitui, Kakamega, Busia, Nandi, Narok, Turkana, West Pokot, and Kwale	10 Metric Tonnes	40 Billion/ Year
Niobium and Rare Earth Elements	Mrima Hills in Kwale County	100 Million Metric Tonnes of Niobium Oxide (Grade 0.7% - 0.8%) 110 Million Tonnes of Rare Earth Oxide Grade 3.1%	Over 1 Trillion
Industrial Minerals (Gypsum, Limestone, Silica sand and Clay)	Homa Bay, Kisumu, Kericho, Kitui, Machakos, West Pokot, Mandera, Marsabit, Isiolo, Wajir, Taita Taveta, Kilifi, Kwale and Elgeyo Marakwet, Garissa, Tana River, Kajiado		50 Billion/ Year
Coal	Kitui, Kilifi and Kwale Counties	1.5 Billion Tonnes MT Mui Basin alone: a) The calorific value of 18 MJ/Kg	50 Billion/ Year
Dimension stones (Granite and Marble)	Meru, Isiolo, Muranga, Nyeri, Kiambu, Nairobi, Homabay, Kericho, Mandera, Vihiga, Kajiado, Kisumu counties	Good quality	10 Billion/ Yea
Agro- Minerals (Apatite, Guano, Limestone, Magnetite, zeolites, Rock phosphate and Vermiculite)	Kwale, Mombasa, Kilifi, Tana River, Kitui, Nakuru, Narok, Nyandarua, Kisumu, Homabay, Bungoma counties	Good quality	10 Billion/ Year
Titanium Minerals (Rutile, Zircon and Ilmenite)	Kwale, Kilifi and Tana River Counties	Total Heavy Mineral content: Kwale ~2.1-5.7% Vipingo ~2% Mambrui ~3.7% Kilifi ~3%	400 Billion Overall
Radio-active Minerals (Uranium and Thorium)	Homabay, Kisumu and Kwale counties	Mineral grades: Uranium ~ 463-507 ppm Thorium ~ 23-26 ppm	50 Billion/ Year

2.1.2. Extraction of Minerals

Mineral resources are not renewable so their depletion reduces their availability in the environment over time. The scale of their extraction can determine the amount of stress placed on the environment. The quantities and corresponding values of various minerals are shown in Table 2.3. Table 2.4 shows the quantity of mineral exports for the period 2020 to 2023.

Table 2.3: Quantity of Main Mineral Production, 2011 – 2023

								Gemstones		Titanium Ore Minerals

2.2. Energy Resources

Energy resources are all forms of fuels used in the modern world, either for heating, generation of electrical energy, or for other forms of energy conversion processes. Energy can be produced from non-renewable (including fossil fuels, peat, uranium, and thorium ones) or renewable sources (including solar, hydroelectric, geothermal, marine and wind energy). Statistics on the production and consumption of energy are required to assist in sustainable energy management. Kenya is endowed with significant amount of renewable and non renewable energy resources. Renewable energy resources include: hydropower, geothermal, biomass, solar and wind while non renewable resources as shown in Table 2.5.

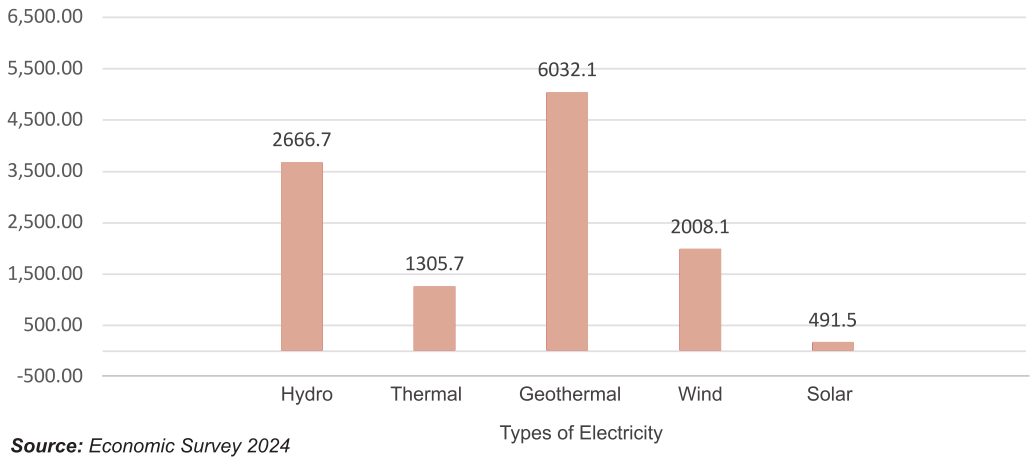
Table 2.5: Electricity Generation by Fuel Type, 2011-2023 in GWh

Type	Hydro	Thermal	Geothermal	Wind	Solar	Total
2011	3,217.20	2,800.50	1,443.70	-	-	7,461.40
2012	3,976.80	2,200.40	1,515.90	-	-	7,693.10
2013	4,386.00	2,161.70	1,780.90	-	-	8,328.60
2014	3,410.60	2,585.20	2,917.40	17	-	8,930.20
2015	3,463.30	1,412.10	4,520.70	59.7	-	9,455.80
2016	3,959.90	1,470.90	4,484.20	56.4	-	9,971.40
2017	2,776.80	2,534.10	4,756.30	61.30	-	10,128.50
2018	3,986.40	1,545.80	5,127.80	375.60	13.68	110,349.28
2019	3,205.30	1,313.30	5,234.70	1,562.70	92.30	11,408.30
2020	4,233.00	754.50	5,059.80	1,331.40	88.40	11,467.10
2021	3,675.00	1,262.00	5,037.00	1,984.80	167.40	12,126.20
2022	3,039.90	1,584.90	5,517.50	2,143.00	383.70	12669.00
2023	2,666.70	1,305.70	6,032.10	2,008.10	491.50	12504.10

Source: *State Department for Energy*

Electricity supply is predominantly sourced from geothermal, hydro and solar/wind and fossil fuel (thermal) sources. This generation energy mix comprises 48.2 per cent geothermal, 21.3 per cent from hydro, 14.5 per cent from solar 3.9 per cent ,wind from 16.1 per cent and 10.4 per cent from fossil fuel (thermal) sources, respectively, as illustrated in Figure 2.1.

Figure 2.2: Electricity Generation by Source, 2023



Source: *Economic Survey 2024*

2.3. Biological Resources

These are genetic resources, organisms or parts thereof, populations, or any other biotic component of ecosystems that have actual or potential value or use to humanity.

2.3.1. Aquatic Resources

Kenya is endowed with both marine and inland water resources.Table 2.6(a) and (b) shows the quantity and value of fish resources in the country.The inland water sources include lakes, dams and rivers of varying sizes while Indian Ocean is the source for marine fish resources.

Table 2.6(a): Quantity of Fish Landed, 2015 – 2023

Lake Victoria's contribution to total annual fish production is enormous even in the face of rapidly declining fish stocks in the lake. The lake is a multi-species fishery with hundreds of known species, but only Rastrien argentea (Omena), Lates niloticus (Nile perch), and Oreochromis niloticus (Nile tilapia) are of economic significance as shown in Table 2.8.

Aquaculture. Aquaculture entails growing (farming) of fish and other aquatic organisms in controlled environment. It is dominated by four commonly cultured fish species namely Nile Tilapia, African Catfish, Rainbow Trout, Common Carp and ornamentals. The aquaculture production by counties for 2020 is presented in Figure 12. Transzoia followed by Kakamega and Kirinyaga were the best performing counties in the country.The ASAL counties of Wajir, Mandera and Garrissa hardly practices aquaculture production.

Figure 2.3: Aquaculture Production by Counties, 2020

2.3.2 Crops

Agriculture remains the backbone of the Kenyan economy. Kenya's agriculture is determined by factors such as climate, hydrology, and terrain as well as agro-ecological factors which determine the suitability of an area for land use. Agricultural potential can be classified into high, medium and low. Intensive cultivation is prevalent in the high-potential highlands where rainfall is high as illustrated in Table 2.10.

Table 2.10: Categories of Agricultural Land (As of 2013)

'000 Ha

[1]*The three categories are defined as follows:*

High potential:annual rainfall of 857.5mm or more (over 980mm in Coast region).

Medium potential: annual rainfall of 735mm-857.5mm.(735mm-980mm in Coast region and 612.5mm-857.5mm in Eastern region).

Low potental:Annual rainfall of 612.5mm or less.

In Kenya, crops are produced under rain-fed and irrigated systems, with the rain-fed system accounting for over 90 percent of all production. Trends in production of selected agriculture commodities is shown in Table 2.11 and Table 2.12.

Table 2.11: Trends in Crop Production

Release of Chemical Substances

Chemical fertilizers to enrich soils and pesticide use in protecting plants and animals from disease are covered here. Other chemicals accelerate the growth of biota and preserve and enhance the quality, size and appearance of biological products. Environmental effects are generated by the diffusion of chemicals through cycling systems and build-up of contaminants in water, land and living organisms (through the food chain). The statistics include the amount of natural and chemical fertilizers and pesticides used by type of active ingredients, the area under application and the method employed. These statistics serve as a proxy or the basis for estimating the chemicals that remain in the environment and affect environmental quality.

Table 2.12 shows the quantity of fertilizer imports for the period . NPK's, DAP & CAN are the imported to Kenya. Comparing the imports for the past four years shows that the top 5 imports have been consistent throughout. Urea imports increased to 8 per cent of the total imports in 2015 as compared to previous year of 5 per cent. Other fertilizers includes products like; Phosphate Rock, SOP, MOP, Potassium nitrate.

Table 2. 12: Fertilizer Imports, 2012-2022, Tonnes

Comments:

NPK's, DAP & CAN accounted for 71% of the total fertilizers officially imported to Kenya. Comparing the imports for the past four years shows that the top 5 imports have been consistent throughout. Urea imports increased to 8% of the total imports in 2015 as compared to previous year of 5%. Other fertilizers include products like; Phosphate Rock, SOP, MOP, Potassium nitrate, etc

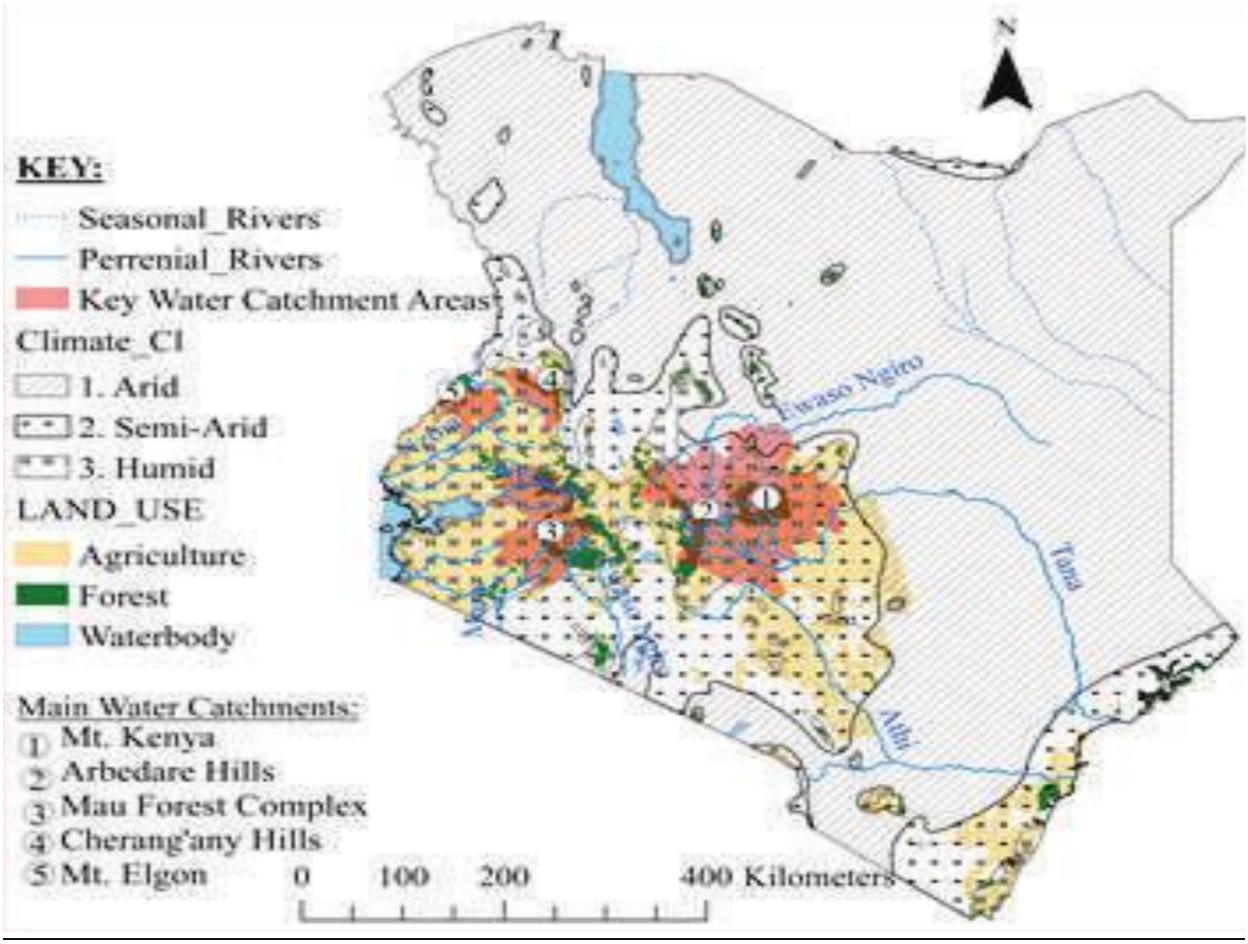
2.3.3. Water Resources

Kenya's natural renewable water resources depend on the fragile catchments covered by montane forests in the country's highland areas where humid climate zone is prevalent. They are the catchments of Kenya's main rivers that make up the five basin areas which include Mt. Elgon, Cherangani Hills, Mau Forest Complex, Aberdare Ranges and Mt. Kenya as illustrated in Figure 2.4.

Figure 2.4: Main Water Catchment Areas of Kenya



Source: *National Water Master Plan 2030*

Water Catchment Areas and Basins .

Kenya has five major basins namely, Lake Victoria, Rift Valley, Athi, Tana and Ewaso Ng'iro North. The largest is Ewaso Ng'iro North with a drainage area of 210,223 sq km , i.e 25 per cent of Kenya, followed by Rift Valley with a drainage area of 130,452 sq km . Tana, Athi and Lake Victoria basins constitute 126,026 sq km, 58,639 sq km and 31,734 sq km respectively.

Table 2.16: Available Water Resources by Basins (Units in Million m³ /year)

Catchment Area	Area (sq.km)	2010	2030	2050
Lake Victoria North Catchment Area	18,374	4,742	5,077	5,595
Lake Victoria South Catchment Area	31,734	4,976	5,937	7,195
Rift Valley Catchment Area	130,452	2,559	3,147	3,903
AthiRiver Catchment Area	58,639	1,503	1,634	2,043

Ewaso Ng'iro North Catchment Area	210,226	2,251	3,011	1,810
Total	**575,541**	**22,564**	**26,634**	**28,437**

Source: *National Water Master Plan 2030*

Table 2.17 presents the water demand in Kenya estimated for the years 2010, 2030 and 2050. The total water demand in 2010 was 3,218 million m³ /year against available 22,564 million m³ /year. The demand will rise to 221,468 million m³ /year in the year 2030 against available 26,634 million m³ /year. Although there seem to be sufficient water to meet the demand, available water resources in Athi basin barely met the demand in the base year of 2009. Because of human activities and climate variability, water availability in space and time has not been guaranteed in the recent years and hence the need to manage and conserve the resource.

Table 2.17: Water Demand per Basin (Units in Million m³ /year)

Catchment Area	Area (sq.km)	2010	2030	2050
Lake Victoria North Catchment Area	18,374	228	1,337	1,573
Lake Victoria South Catchment Area	31,734	385	2,953	3,251

The total renewable water resources of Kenya is estimated to be 76.6 billion m³/year, of which approximately 20.6 billion m³/year is surface water and 55.973 billion m³/year is ground water. The total water demand for the various sectors is projected to increase from 1,616.0 million m³ / year in 2018 to 3,429.0 million m³ /year in 2030 and is expected to grow to 5,093.0 million m³ /year in 2050, as shown in Table 2.18.

Precipitation: Rainfall is the main source of water in Kenya. The long-Term Average (LTM) gives an indication of availability of this natural resource. Renewable water resources presented in Table 2.20 is the available maximum amount of water resources. It is estimated by multiplying the value of annual precipitation minus actual annual evapotranspiration.

Table 2.20: Renewable and Available Water Resources in Kenya, 2010-2050

Item	Unit	2010	2020	2030	2050

GCM-General Circulation Model

GW-Ground Water

Bn m^3/y – Billion M^3 per year

Water Resources per Capita. The per capita available water resource is calculated by using the renewable surface water resources and sustainable groundwater yield as shown in Table 2.21. The per capita renewable and available water resources have much decreased toward year 2030.

Water abstracted and availability, The volume of water abstracted under permit is an indicator of water availability to the population. The trend in abstraction/water usage in the country is presented in Table 2.22. The trend shows a gradual but not steady increment in water abstraction.

Water Abstraction have been increasing steadily from 2016 to date, due to awareness created by Water Resources Authority (WRA), on the need for the abstractors to use water as stipulated in the Water Act 2016 and enforcement of the same. There is increased demand for irrigation water due to unreliable rainfall and climate change occurrence.

Water abstraction have increased form 32.34 Million to 32.42 Million cubic meters per year from 2016 to 2022. Surface water accounts for 99.28% of the total abstractions while the rest are from ground water. It is worth noting that Kenya depends highly on Hydropower hence power generation takes slightly over 96% of all abstractions followed by irrigation and public use in that order.

The Tana Basin Area allocates the biggest amount of surface water mostly for hydropower generation followed by Rift Valley Basin area. Water abstraction by Water Service Providers in major towns across the country is presented in Table 2.27. It is important to note that the difference between the total water produced and supplied through the water distribution system and the total water billed to customers which is referred to as non-revenue water which have remained relatively stagnant between 41 per cent and 47 per cent for the last 10 years is as a result of the physical losses like water leakage, and apparent losses such as illegal connections and meter inaccuracies. Effort are being made to reduce the Non-Revenue Water to 25 per cent to close the supply and demand gap without the need to build costly infrastructure or exploit new water sources (which are dwindling). Additionally, reducing water losses increases revenue for utilities while also reducing operating costs linked to producing and pumping water, thus unlocking savings that can be used to expand access and improve service delivery.

Access to Water and Sanitation services

The water coverage in regulated areas increased by three percentage points from 62 per cent to 65 per cent. mainly because of population served with water increasing at a rate of 10.8 per cent compared to a 5.7 per cent increase of the population within the Service Area.

65%

The water coverage in regulated areas increased by three percentage points from 62 per cent to 65 per cent.

Water Use and Expenditure by Economic Activity

Water use and its value by economic activities is presented in Table 2.31. In 2019, total volume of water used amounted to 11.5 million cubic meters. Sectors with the highest volume of water use includes electricity, gas, steam, and air condition, and manufacturing.

Table 2.31: Water Use and Expenditures by Economic activities, 2019

Industry	Quantity(m	Value
	mn m^3	KSh million
Mining and quarrying	12.3	2,525.0
Manufacturing	408.8	52,168.4
Electricity, gas, steam and air conditioning supply	10,995.9	5,076.4
Water supply; sewerage, waste management and remediation activities	57.8	2,985.6
Construction	8.2	1,362.0
Total	**11,483.0**	**64,117.3**

Source: *Census of Industrial Production Report, 2019*

Water and Sewerage Companies (WASCOs) were the main source of water for most economic sectors as presented in Table 2.32. The mining and quarrying sector sourced most of the water from lakes, rivers, borehole, wells, and dams.

Table 2.32: Proportion of Water Used by Economic Activity by Source

Per cent

Economic Activity	WASCO	Vendor	Rain water	Lakes/ rivers/ boreholes/ wells or dams
Mining and quarrying	26.3	8.9	8.0	56.9
Manufacturing	50.1	9.2	2.1	38.7
Electricity gas, steam and air conditioning supply	67.5	32.5	0.0	20.0
Water supply; sewerage, waste management and remediation activities	39.9	5.7	2.0	52.3
Construction	53.0	27.4	2.5	17.2

2.3.4. Conclusion

This second chapter is closely related to the asset and physical flow accounts of the SEEA-CF .It gathered statistics on natural resources, such as subsoil resources (mineral and energy), soil resources, biological resources and water resources, and land. They may be naturally renewable (e.g., fish, timber, or water) or non-renewable (e.g., minerals). For Kenya, statistics are provided by Water Resources Authority, Ministry of Agriculture, KNBS etc. The next chapter will present statistics on residues.

03

RESIDUALS

3.0. Introduction

This component contains statistics on amount and characteristics of residuals generated by human production and consumption processes, their management, and their final release to the environment. Residuals are solid, liquid, and gaseous materials that are discarded, discharged, or emitted through processes of production, consumption and accumulation. Residuals may be discarded, discharged, or emitted directly to the environment or be captured, collected, treated, recycled, or reused. The main groups of residuals are emissions, wastewater, and waste.

3.1. Emissions to Air

The summary of Green House Gases (GHGs) emissions, which are the drivers of climate change is presented in Table 3.1. Kenya's total GHG emissions in 2010 were 69.6 million metric tons of carbon dioxide equivalent (MtCO2e), totalling 0.13 per cent of global GHG emissions. The agriculture sector emitted 61.1 per cent of total emissions, followed by the energy sector (30.4 per cent), industrial processes sector (4.6 per cent), and waste sector (3.9 per cent).

Table 3.1: Summary of Greenhouse Gas Emissions and Removals by Sectors

Sector	GHG Emission ($MtCO^2e$)				
	1995	2000	2005	2010	2015
Forestry (LULUCF)	10	21	18	21	26

Total	**44**	**56**	**57**	**69**	**80**

Source: *Government of Kenya 2015. Kenya Second Communication to the UN Framework Convention on Climate Change*

The two main types of greenhouse emissions are direct and indirect greenhouse gas emissions.

Direct greenhouse gases. Direct GHGs emissions are emissions from sources that are owned or controlled by the reporting entity as shown in Table 3.2. The direct greenhouse gases are carbon dioxide (CO2), nitrous oxide (NO2), and methane (CH4). As shown in Table 3.2, the highest was from methane (CH4) with a total of 15,768 Gg. Carbon dioxide emission had negative 22,750 Gg while Nitrous Oxides had 448.17 Gg during the same period.

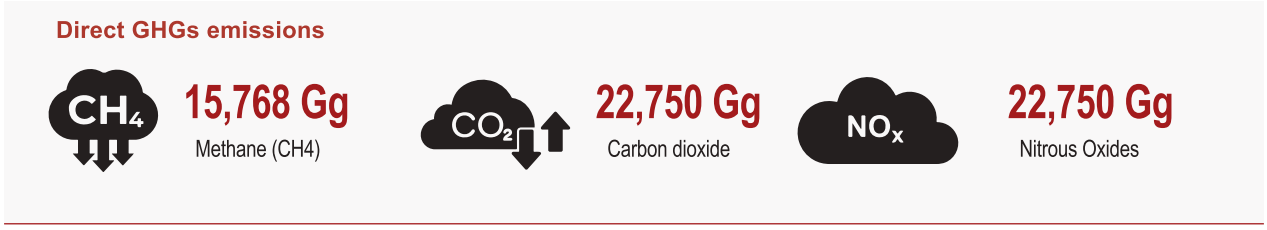

Table 3.2: Emissions of Direct Greenhouse Gases

Indicator	Gas	2010
Emissions of direct greenhouse gases	Carbon Dioxide	22,750
	Methane	15,768
	Nitrogen Dioxide	448.17
	Agregates GHGs	6,533.83

Source: *Government of Kenya 2015. Kenya Second Communication to the UN Framework Convention on Climate Change*

Indirect gas emission. Indirect GHGs emissions are as a consequence of the activities of the reporting entity but occur at sources controlled by another entity. The indirect greenhouse gases are Non-Methane Volatile Organic Compounds (NMVOCs), nitrogen oxides (NOx) comprising of nitrogen monoxide (NO) and nitrogen dioxide (N2O), sulphur dioxide (SO2), and carbon monoxide (CO) as shown in Table 3.3.

Table 3.3: Emissions of Indirect Greenhouse Gases (SO2, NOx, CO, NMVOC), 000 Metric Tons

GHG Inventory in (CO^2 eq-Gg)			
Gas	**1994**	**2000**	**2010**
HFCs		118	86
Nox	50.9*		
CO	1656.8*		
NMVOC	6.0*		
SO2			

Source: *GoK 2015. Kenya Second Communication to the UN Framework Convention on Climate Change*

Note *1. 1 Gg = 1000 metric tons*

2. Start Year on record and Last Inventory Year vary.

3. Total emissions include LULUCF/LUCF (Land Use, Land-Use Change and Forestry).

Activities in the LULUCF sector can provide a relatively cost-effective way of offsetting emissions, either by increasing the removals of greenhouse gases from the atmosphere (e.g. by planting trees or managing forests), or by reducing emissions (e.g. by curbing deforestation). However, there are drawbacks as it may often be difficult to estimate greenhouse gas removals and emissions resulting from activities of LULUCF.

Table 3.4 shows emissions of Carbon dioxide by sectors. The road transport is the main emitting sector contributing over 58 per cent of emissions in 2010 followed by manufacturing/construction and energy industries at 13.6 per cent and 10.7 per cent, respectively.

Table 3.4: Carbon Dioxide Emissions by Sectors in Kenya

Source	Energy Sub-Sector	CO_2 Emissions (Gg)				% Change 2005-2010
		1995	2000	2005	2010

3.2. Consumption of Ozone Depleting Substances

Ozone depleting substances (ODS) are substances or chemicals that are harmful to the ozone layer in the upper atmosphere. This indicator is used to monitor the reduction in the usage of Ozone Depleting Substances (ODSs) as a result of the Montreal Protocol. The Montreal Protocol is mandated to monitor the use and phasing out of these substances. Reducing consumption ultimately leads to reductions in emissions since most uses of ODSs finally lead to the substances being emitted into the atmosphere. As there are several ODS, the target is to phase out first the most harmful ones. Table 3.5 shows the depleting substances commonly in use and year the substance was phased out.

Table 3.5: List of Ozone Depleting Substances

Name of Ozone Depleting Substances	Description	Any other information
Chlorofluorocarbons (CFCs)	- CFCs are organic compounds that contain carbon, chlorine and fluorine - CFCs have been banned - Before CFCs were banned, they were used in aerosols, refrigerators, air conditioners, foam food packaging, and fire extinguishers	CFCs were phased out in the year 2010
Halons	- Halons are chemical compounds formerly used in fire fighting - A group of compounds containing bromine and fluorine and one or two carbons	Phased out in the year 2010
Carbon Tetrachloride (CTC)	- Listed as an ozone depleting substance (ODS) in 1990 - Used as a solvent - Used as a refrigerant	Phased out in the year 2010
Methyl Chloroform	- Listed as an ozone depleting substance (ODS) in 1990 - Used as a solvent	Phased out in the year 2015
Hydro chlorofluorocarbons (HCFCs)	- HCFCs are a group of man-made compounds containing hydrogen, chlorine, fluorine and carbon - HCFCs are chemicals that are mainly used as refrigerants - HCFC commonly called R22 is often used in air conditioning equipment	The Montreal Protocol set the year 2013 as the time to freeze the consumption and production of HCFCs, reduce consumption and production by 10% in 2015, and a further reduction in consumption by 35% in the year 2020. The goal is to phase out HCFCs completely by 2030
Hydro bromofluorocarbons (HBFCs)	- Historically used in fire suppression systems and fire fighting	Phased out in the year 1996 Not used in Kenya
Bromo	- Listed as an ozone depleting substance (ODS) in 1999	Phased out in the year 2002
chloromethane (CBM)	- CBM was once used in fire extinguishers	Not used in Kenya
Methyl Bromide	- A fumigant used to control pests in agriculture and shipping - Used to treat perishable commodities and buildings	Methyl Bromide use in soil fumigation was phased out in 2015 except for critical use exemption Use of methyl bromide in quarantine and pre-shipment (QPS) treatment is not controlled by the Montreal Protocol

3.3. Generation and Management of Wastes

Statistics on the amount and characteristics of waste, defined as discarded material for which the owner or user has no further use, generated by human activities in the course of production and consumption processes, are considered here. To reduce the amount of waste generated and increase the share of waste that is recycled and reused as material or energy source are central to sustainable consumption and production and natural resource management. The final disposal of waste in the environment, even if in a controlled manner, creates pollution and occupies considerable land areas.

Solid Waste

Waste collection is a critical step in managing waste. Volume of solid waste generated and collected to designated sites by the four cities of Nairobi, Mombasa, Kisumu and Nakuru is presented in Table 3.6.

Table 3.6: Total Amount of Municipal Solid Waste Generated, '000 Tonnes

County		2018	2019	2020	2021	2022	2023*
Nairobi⁺	Generated	730.0	839.5	876.0	1,095.0	1,095.0	1,191.5

** Provisional*

⁺ Revised

Waste Composition. The overall composition of wastes in Nairobi is as shown in Figure 15. Organic waste which is also known as biodegradable waste, is produced mainly from living organisms, either plant or animal. These wastes include food waste, human waste, sewage, paper waste, manure, green waste, and slaughterhouse waste comprise of 70 per cent of total waste generated in Nairobi county.

Figure 3.1:Composition of Solid Waste

3.4. Clinical/Medical Waste

Data on clinical/medical waste is available in three (3) microwave/shredding technology sites in Kenya. These are Kenyatta National Hospital, Moi Teaching & Referral Hospital and Nakuru Level-5 hospital. The daily microwaved/shredded waste from the three sites in 2018 is as shown in Table 3.7.

Table 3.7: Daily Clinical Waste

Name of Hospital	Status of Hospital	Daily Waste Microwaved/shredded/kg
Kenyatta National Hospital	National	2,100
Moi Teaching & Referral Hospital	National	1,800
Nakuru Level-5 Hospital	County Referral	1,800

Source: *Ministry of Health, 2018*

Total amount of solid waste generated by industrial and construction sectors in 2017 was 81.6 million tonnes. The manufacturing sector contributed the largest quantity of solid waste generated at 79.2 million tonnes. Waste generated by type of waste and economic activity is shown in Table 3.8.

Table 3.8: Waste Generated by Type of Waste and Economic Activity

Sector	Solid Waste (tons)	Hazardous Waste (kg)	eWaste (kg)	Liquid waste/Waste water (cubic metres)
Mining and quarrying	895.0	733.0	-	66,101.0
Manufacturing	79,207,012.0	4,259,071.0	15,527.0	179,692,217.0

3.5. Conclusion

The third chapter above contains statistics on the amount and characteristics of residuals generated by human production and consumption processes, their management, and their final release to the environment. Statistics in this chapter are provided by KNBS, Nairobi City County, the Ministry of Health, the Ministry of Environmentand Forestry,etc.

04

NATURAL EXTREME EVENTS AND DISASTERS

4.0. Introduction

This component organizes statistics regarding the occurrence and impacts of extreme events and disasters on human wellbeing and on the infrastructure of the human sub-system.

4.1. Occurrence of Natural Extreme Events and Disasters

Over the years, Kenya has been exposed to various forms of disasters such as droughts, fires, floods and industrial accidents. Some of these have slow-onset while others have rapid-onset characteristics. Slow-onset disasters are cyclical in nature, they impinge on large human populations and their effects can be predicted, controlled and prevented. Rapid-onset disasters affect fewer people; they take place at any time, may be violent and require a quick response. To address these challenges, the government established the National Disaster Operation Centre (NDOC) which documents and finds solutions to national disaster.

4.1.1. Type of Natural Extreme Events and Disasters

Kenya experiences several natural hazards, the most common being weather related, including floods, droughts, fires, landslides, traffic accidents and disease outbreaks.

Droughts:

Kenya has experienced several episodes of drought, both short-term (2 years and below) and long-term (above two years). Between 1993 to date, the government has declared 7 national disasters out of which 5 were drought related. These declarations followed the droughts of 1992-93, 1996-97, 1999-2000, 2005-06 and 2008-09. Some of the notable droughts occurred in 2004 and 2008 -2011. 2014-2016 and 2019 as in Table 4.1.

Table 4.1: Chronology of Drought Incidences in Kenya Since 1883

1883	Coast Province	Worst famine in 30 Years
1889 - 1890	Coast Province	One year of drought and famine
1894 - 1895		Information not available
1896 - 1900	Coast Province	Severe drought
1907 - 1911	Countrywide	Failure of three consecutive rainy seasons, human deaths
1913 - 1919	L. Victoria, Machakos, Kitui and Coastal Regions	Minor food shortages
1921	Eastern and Coastal regions	Impacts exacerbated by warfare
1925	Rift Valley, Central and Coast Provinces	Local food shortages, Crop and Livestock losses (50% in Baringo District)
1938 - 1939	Northern Rif Valley and Central Province	Heavy loss of livestock, Lorain swamp dried up and deaths occurred
1942 - 1944	Countrywide	Food shortages, about 200 deaths reported
1947 - 1950	Central, Coast, Eastern, Nyanza, Western and Rift Valley Provinces	Significant drought.
1952 - 1955	Eastern Province, South/North of Rift Valley Province	Droughts followed by floods, cattle mortality at about 70 - 80% in Maasai land
1960 - 1961	Widespread	Rains about 50% long-term mean, Nairobi water shortage, Wildlife death in the Nairobi National Park.
1972	Most of Kenya	Human and Livestock death in the Northern districts, Maasai cattle losses about 80%
1973 - 1974	Eastern, Central, Northern regions	Crop production paralyzed

Table 4.1: Chronology of Drought Incidences in Kenya Since 1893 *(Continued)*

1974 - 1976	Central, Eastern, Western, coast	Famine in eastern province Water shortages, migration of people and livestock. Large food deficits
1980	Eastern province	Famine in eastern province Water shortages, migration of people and livestock. Large food deficits
1981 - 1983	Countrywide	Severe food shortages in Eastern province
1984	Central, Rift Valley, Eastern and North Eastern	Moderately Severe in Eastern Province, Relief food imported.
1987	Eastern and Central	4.7 million people dependent on relief power and water rationing
1992 - 1994	Northern, Central, Eastern Provinces	Ethnic violence after the 1992 elections
1999 - 2000	Countrywide except west and coastal belt	Droughts, floods and landslides
2004	Pastoral communities	About 3 million people in need of relief aid for 8 months to March 2005 70% loss of livestock in some pastoral communities
2005	Pastoral communities	2.5 million people close to starvation
2006	Widespread	40 human lives lost and about 40%cattle, 27% sheep and 17% goats lostDeclared a national disaster
2007-08	Widespread	4.4 million people affected, 2.6 million people at risk of starvation, up to 70% loss of livestock in some dpastoral communities 3.5 million in need of food by September
2009	Widespread	70-90% loss of livestock by Maasai pastoralists
2011	Garissa, Isiolo, Wajir,Mandera, Mombasa,Marsabit, Nairobi, Samburu andTurkana Counties	4.3 million people were in dire need of food
2012	Widespread	3.75 million people in dire need of food
2016-2017	widespread	Nearly 2.7 million people were estimated to be in need of food aid,
2019	widespread	1.1 to 2.5 million people in need of food

Source: *National Drought Management Authority*

Floods and Landslides:

Floods can be describes as excess flows exceeding the transporting capacity of rivers, lakes, ponds, dams and any other water body where water inundates outside the water body Aris MM (2003). Many factors and conditions contribute to the occurrence of floods in Kenya. The country has in the past experienced flash floods, river floods and coastal floods. In some cases, the human interference with watersheds, drainage basins, riparian zones and flood plains may cause floods. Floods have occurred in the river basins even with normal rains because of excess surface water runoff occasioned by deforestation, poor cultivation methods and land degradation upstream. Kenya is affected by floods following torrential rainfall. These forces thousands of people living in the lowlands to move to higher grounds for safety. The people affected are mostly in Western, Nyanza provinces (Budalangi) and Tana River district. However, slum dwellers in towns like Nairobi who have erected informal structures near rivers have not been spared either due to poor drainage systems.

The record of the flood disasters in Kenya as shown in Table 4.2 identifies the worst floods recorded in 1961- 62 and 1997-98, the latter ones being the most intense, most widespread and the most severe. During 1997-98, the flooding was associated with the El Nino phenomenon.

Landslides on the other hand are a form of soil erosion that results from a downward and outward movement

of slope-forming materials including rocks, soils, and artificial fills. Landslides are among the major natural disasters in mountainous regions of Kenya having the highest number of recorded incidences of landslides. Negative impacts of landslides include soil erosion, land degradation, loss of land value, loss of life, loss of property, destruction of infrastructure including roads and bridges, displacement of people, boundary conflicts, and siltation of rivers. Landslides occurrence is closely related to rainfall, land slope, land cover, soil type and geology. Major landslide triggers include heavy continuous rainfall in soils with infiltration rates greater than internal drainage, deforestation of steep slopes, slope instability caused by man-made cuts in hills during road construction or excavation of toe-slope and gullies. Some of the areas prone to landslides in Kenya include Muranga and Elgeyo Marakwet counties as shown in the landslide risk maps below. Subsequently effects of floods and landslides are shown in Table 4.2.

Table 4.2: Recent Floods and Landslides and Their Effects in Kenya

Year	Disaster type	Location	Effects
2023	El~Nino	Widespread	120 people killed, 546,000 people displaced
2018	solai dam tragedy	Nakuru	48 people killed
2015	Floods	Widespread	15 people killed and thousands displaced Infra-structure destroyed
	Landslides	Muranga County	Landslides
	Floods	Tana River County	82,000 people displaced
2013	Landslides	Nyeri, Murang'a, Kisii	2,000 people displaced
2012	Floods	Nyanza/Western	84 people killed, 30,000 displacedAbout 280,000 people affectedcountrywide
	Landslides	ElgeyoMarakwet County	10 people killed, hundred displaced
2010	Floods	Budalangi, Tana river, Turkana	73 killed, 14,585 people affected
	Landslides	Bududa, Mt Elgon , Samburu	3000 people buried, property destroyed
2008	Floods	Rift valley, Kitale, Makueni,Mwala/ Kibwezi, Bundalangi	24 people killedwith 2396 affected
	Mudslides	Pokot central	11 people killed
2007	Mudslides	TaitaTaveta County	3 dead
2006	Floods	Widespread	7 deaths, 6,500 people displaced
2005	Storm	Merti – Isiolo	4,000 people cut-off between Isiolo and Merti for 7 days
2004	Floods/ Land Slides	Nyeri/OthayaKihuri	5 people dead
2003	Floods	Nyanza, Busia, Tana River	170,000 people affected by severe floods
2002	Floods	Nyanza, Busia, Tana River	150,000 people affected
	Landslides	Meru Central, Murang'a, Nandi	2,000 people affected
1997-98	El Nino Flood	Widespread	1.5 million affected
1985	Floods	Nyanza, Western Province, Tana River	10000 Persons affected
1982	Floods	Nyanza	4000 Persons affected

Fires

Fire accidents have the most diverse causes of all the disasters. Fire disasters are very common in both developed and developing countries. They have diverse causes which are either man-made or natural. However, most of the fire disasters are man-made and include electrical faults (mostly due to overloading and short circuits), pantry area (cooking gas leaks, cooking oil, overheating of cooking medium), smoking (in/around combustible medium, falling hot ashes from the cigarette on a flammable material) and arsonist attacks.

Wildfires as a result are a common occurrence in the arid ASALS due to the high temperatures experienced during the drought season. The extent of damage, however, depends on the type of fire (nature of the material ablaze), the meteorological conditions (wind) and the effectiveness of the intervention. Table 4.4 shows some of the fire disasters in Kenya in the recent past.

Table 4.4: A Summary of the Major Fire Disasters

Disaster	Year	Cause	Effects
Oil spill from an overturned fuel truck	2009	Likely causes, static electricity, accidentally discharged cigarette	Mortality cases-113, Critical injuries- over 200 , Considerable environmental damage
Sachangwan, Oil tanker fire	2020	Victims were siphoning fuel from the overturned fuel tanker	Mortality cases- 4, Critical injuries - 50
Fire inside Nakumatt Nairobi town supermarket	2009	Likely from power systems default in the building	Mortality cases- 30, Several injuries and missing persons
Kenya Pipeline Company Fire outbreak in one of the Eastland's estates of Nairobi (Sinai Case)	2011	The state owned Kenya Pipeline Company had one of its fuel tank with a massive leak	Mortality cases - over 100, Several injuries, Massive property damage
Kyanguli Boys school	2001	Suspected arson	68
Bombolulu girls school	1998	Suspected arson	25
City Hall Nairobi	2004	Suspected arson	70 M none
Lamu	1982 1990	unknown	No record
Free market Nairobi	2001	unknown	Millions worth of merchandise

Source: *National Disaster Operation Centre*

Locust Invasion

The desert locust is a winged insect that travels in swarms, consuming almost every leaf of green vegetation in its wake. Kenya experienced its worst locust invasion in 70 years in 2020.

Structural Collapse

Disasters associated with collapse of buildings have been on the rise in the recent past in Kenya becoming death traps and causing huge financial losses. Such disasters occur due to structural failure as presented in Table 4.5.

Table 4.5: A Summary of the Major Structural Collapse Disasters

Year	Location	Effects
2006	Five-storey building under construction in the central business district in Nairobi	killed 11 and trapping over 200 workers under the debris
2009	Kiambu town	Data not available
2010	Kiambu town	Data not available
2011	Embakasi	Data not available
2011	Langata Southern Bypass	Data not available
2011	Luanda	Data not available
2012	Mlolongo along Mombasa Road	5 people killed and 10 injured
2013	Nairobi CBD	11 people killed and 200 trapped
2014	Nairobi	1 person killed
2015	Mukuru Fuata Nyayo area of South B	9 people killed

Source: *National Disaster Operation Centre*

4.2. Technological disasters

Road Transport

More Kenyans lose their lives in road traffic crashes every year as shown in Table 4.6. Many of these people are vulnerable road users–pedestrians, motorcyclists, and cyclists. In addition, nearly one-third of deaths are among passengers, many of whom are killed in unsafe forms of public transportation. The number of accidents ranges between 5,000 to over 10,000 annually as in Table 4.6.

Table 4.6: Technological Disasters Road Transport Accidents (Numbers)

Description	2012	2013	2014	2015	2016	2017	2018	2019	2020	2021	2022	2023

Economic Survey 2024

4.3. Conclusion

This chapter organized statistics on the occurrence of extreme events and disasters and their impacts on human well-being and the infrastructure of the human sub-system. The most common data providers are National Disaster Operation Centre, national police service and DRSRS. The next will organise statistics on human settlements and environmental health.

05

HUMAN SETTLEMENTS AND ENVIRONMENTAL HEALTH

5.0. Introduction

This component presents statistics on the built environment in which humans live, particularly with regard to population, housing, basic services, living conditions and environmental health. These statistics are important for the management and improvement of conditions related to human settlements, shelter conditions, safe water, sanitation, and health. This is critical in the context of rapid urbanization, increasing pollution, environmental degradation, disasters, extreme events, and climate change.

5.1. Human Settlements – Urban and Rural Population

Population and its related statistics denote the pressure on the environment out of the activities carried out, including habitations. Tables 5.1 and Figure 5.1 show varying population sizes and facilities accessible to the people.

Table 5.1: Population in Millions and Population Density, 1962 – 2019 (People Per sq. km of Land Area) [1]

Year	Urban	Rural	Total	Population density
1962	0.63	7.97	8.6	14.81
1969	1.07	9.82	10.9	18.77
1979	2.31	12.99	15.3	26.35
1989	3.88	17.52	21.4	36.86
1999	9.9	18.8	28.7	49.43

5.2 Access to Selected Basic Services

Basic services such as electricity and energy, water and sanitation, refuse and waste removal are critical services to improve the lives of people.

Definition of Terms

Population using basic drinking water service- Is the population using an improved drinking water source/ facility with a total collection time of 30 minutes or less for a round trip, including queuing.

Population using safely managed drinking water services- Is the population using an improved source of drinking water (improved source of drinking water include: piped water into dwelling yard or plot, borehole or tube wells, protected dug wells, protected spring, rainwater and packaged or delivered water) which is located on premises, available when needed and free of (faecal and priority chemical) contamination.

Population using basic sanitation services- Population using an improved sanitation facility (improved sanitation facilities include: flush/pour flush to piped sewer system, septic tank or latrine; ventilated improved pit latrine, composting toilet or pit latrine with slab) which is not shared with other households.

Population using safely managed sanitation services-Population using improved sanitation facilities (improved sanitation facilities include: flush or pour flush to piped sewer systems; septic tanks or pit latrine; ventilated improved pit latrine; composting toilet or pit latrine with slab) which is not shared with other household and where excreta are treated and disposed in situ or transported and treated offsite

5.2.1. Access to Water by Households by Type of Source in Kenya

Nationally, improved water supply coverage increased from 52.6 per cent in 2009 to 64.8 per cent in 2019 as shown in Table 5.2. In 2009 and 2019, Urban areas had more water source coverage (71.7 per cent and 78.9 per cent) compared to rural areas where more than half of the households (56 per cent and 44.1 per cent) obtained water from unprotected sources. The data shows that piped water (i.e. piped & piped into dwelling) is the main source of water for urban residents while streams/rivers is the main source for the majority in rural areas.

Source: *According to background characteristics, Kenya DHS 2022*

Access to basic services includes facilities accessible to the people such as access to drinking water and basic sanitation facilities. Good infrastructure services especially water supply, sanitation, and solid waste management remain a challenge in rapidly urbanising Kenya. Nationally, population covered by the main sewer improved from 7.7 per cent in 2009 to 9.7 per cent in 2019 as presented in Table 5.3. Population using open defaction reduced from 13.7 per cent in 2018 to 7.4 per cent in 2019.

5.2.2. Population Using Safely Managed Drinking Water Services

Safely managed drinking water services includes measures for protecting supplies and ensuring water is safe to drink. Households are considered to have access to safely managed drinking water service when they use water from a basic source on premises. The proportion of population as at 2017 using safely managed drinking water services is 22.6 per cent while basic water services is 37.9 per cent.

Access to basic services includes facilities accessible to the people such as access to drinking water and basic sanitation facilities. Good infrastructure services especially water supply, sanitation, and solid waste management remain a challenge in rapidly urbanising Kenya.

5.2.3. Population Using Safely Managed Sanitation Services, Including a Hand-Washing Facility with Soap and Water

The overall objective of the government of Kenya is to achieve access to adequate and equitable sanitation and hygiene for all and end open defecation, paying special attention to the needs of women and girls and those in vulnerable situations. In 2017, proportion of population using safely managed sanitation services was 20 per cent while those using basic sanitation services was 5 per cent. The data shows that 22.8 per cent of the population had limited sanitation services while 40 per cent and 12.5 per cent of the total population were using unimproved sanitation services and open defaction.

5.2.4. Proportion of Wastewater Safely Treated

The Government aims to improve water quality by reducing pollution, eliminating dumping and minimizing release of hazardous chemicals and materials, halving the proportion of untreated wastewater and substantially increasing recycling and safe reuse globally. In 2016, the total volume of waste water/ sewerage reaching treatment plants was estimated to be about 80,045,795 m^3, out of which only 53 per cent was treated to national standards as shown in Table 5.11.

Table 5.11: Proportion of Wastewater Safely Treated, 2016

	Proportion
Proportion of improved piped to sewers which Reach treatment plants	80%
Proportion of WW reaching treatment plants which is treated to standards	53%
Total volume sewerage to be treated (m^3)	80,045,795
Volume treated (m^3)	42,384,311
Volume not treated (m^3)	37,661,480

5.2.5. Integrated Water Resources Management.

In 2016, the degree of implementation of Integrated Water Resources Management (IWRM) was 43.3 per cent thus signifying medium implementation of IWRM in Kenya as shown in Table 5.12.

Table 5.12: Degree of Integrated Water Resources Management Implementation, 2016

5.2.6. Transboundary Basin Area With an Operational Arrangement for Water Cooperation.

The proportion of transboundary basins' area with an operational arrangement for water cooperation.in Kenya is 26 per cent as illustrated in Table 5.13.

Table 5.13: Proportion of Transboundary Basin Area with an Operational Arrangement for Water Cooperation

	Surface area (in km²)
Total surface area of transboundary basins / sub-basins of rivers and lakes covered by operational arrangements within the territory of the country ((in km²) [A] (do not double count sub-basins) - Lake Victoria Basin & Sio Malaba Malakisi River Basin	53,000
Total surface area of Transboundary basins/sub-basins of rivers and lakes NOT covered by operational arrangements within the territory of the country ((in km²) (Lake Turkana, Lakes Chala & Jipe and Umba River Basins and Daua River Basins)	94,600
Total surface area of Transboundary basins of rivers and lakes within the territory of the country (in km²) -[B] (do not double count sub-basins)	147,600
Total surface area of transboundary aquifers covered by operational arrangements within the territory of the country (in km²) [C]	0
Total surface area of transboundary aquifers within the territory of the country (in km²) [D]	50,500

Source: *Ministry of Water, Sanitation and Irrigation*

Notes: *The areas for aquifers are generated from shape files from tba_map 2015 provided by UNESCO. Further, the above map did not include shape files for Kiunga aquifer shared between Kenya and Somalia and the aquifer basin around Lake Victoria... Indicator value for the country ((A + C) / (B + D)) x 100% and is: (53,000/198,100) x 100% = 26%*

5.3.1 Vector -borne Diseases

The World Health Organization(2017) has defined vector borne diseases as illnesses caused by parasites, viruses and bacteria that are transmitted by mosquitoes, sand flies, triatomine bugs, black flies, ticks, tse tse flies, mites and lice. Vector borne diseases account for 17% of all infectious diseases, causing more than 700,000 deaths annually, worldwide. More than 3.9 billion people in over 128 countries are at risk of contracting dengue, with 96 million cases estimated per year. Malaria causes more than 400 000 deaths every year globally, most of them children under 5 years. Other diseases such as chagas disease, leishmaniasis and schistosomiasis affect hundreds of millions of people world wide. Many of these diseases are preventable through informed protective measures (WHO, 2017). The burden of these diseases is highest in tropical and sub-tropical areas and they disproportionately affect the poorest populations. Since 2014, mafor outbreaks of dengue, malaria, chikungunya, yellow fever and zika have afflicted populations, claimed lives and overwhelmed health systems in many Countries (WHO, 2017). Disease causation by vector is hereby given(WHO, 2017) as: Mosquitoes, Aedes - Chikungunya, Dengue fever, lymphatic filariasis, Rfr VALLEY FEVER, yellwo fver, zika, Anopheles - Malaria, Lymphatic filariasis, Culex - Japanese encephalitis, Lymphatic filariasis, West Nile fever, Sandflies, Leishmaniasis, Sand fly fever (Phelebotomus fever), Ticks, Crimean-Congo heamorrhagic fever, Lyme disease, Relapsing fever, Rickettsial diseases (Spotted fever & Q fever), Tick-borne encephalitis, Tularaemia, Triatomine bugs, Chagas disease (American trypanosomiasis), Tsetse flies, Sleeping sickness (African trypanosomiasis), Fleas,Plague,Rickettsiosis, Black flies, Onchocerciasis (river blindness), Aquatic snails, Bilharzia (schistosomiasis), Lice,Typhus & louse-borne relapsing fever.

In Kenya, vector-borne diseases have been reported through the health facilities -centralized DHIS (District Health Information System, MOH) system.

5.4. Conclusion

This fifth chapter contains statistics on the environment in which humans live and work, particularly with regard to living conditions and environmental health. These statistics are important for the management and improvement of conditions related to human settlements, shelter conditions, safe water, sanitation and health, particularly in the context of rapid urbanization, increasing pollution, environmental degradation, disasters, extreme events and climate change. The country must take protective measures fot their people. Information needed are provided by Ministry of Health, Ministry of Water, Sanitation and Irrigation etc. The sixth chapter will gather statistics on environmental protection, management and engagement.

These statistics are important for the management and improvement of conditions related to human settlements, shelter conditions, safe water, sanitation and health, particularly in the context of rapid urbanization, increasing pollution, environmental degradation, disasters, extreme events and climate change.

06

ENVIRONMENTAL PROTECTION, MANAGEMENT AND ENGAGEMENT

6.0 Introduction

This Chapter discusses information on environmental protection and conservation, stakeholder engagement and natural resources expenditure. It aims at improving the utilization of the environment and natural resources for socioeconomic development, and sustaining the health of ecosystems. Statistics about environmental governance, institutional strengthening, enforcement of regulations and extreme event preparedness are also considered.

6.1 Environmental Protection and Resource Management Expenditure

Environmental protection is the practice of protecting the natural environment by individuals, organizations and governments. Its objectives are to conserve natural resources and the existing natural environment and, where possible, to repair damage, restore and reverse environmental degradation.

6.1.1 Annual Government Environmental Protection Expenditure

Annual government environmental protection expenditure provides how much the government spends on activities aimed at environmental protection, conservation, elimination of pollution and strenghthening environmental governance.

Table 6.1: Expenditures by the National and the 47 County Governments

	2014/15	2015/16	2016/17	2017/18
County Governments	5,277.20	13,724.10	10,164.80	13,758.70
National Government	17,234.50	18,105.00	11,303.90	20,065.80
Total	**22,511.70**	**31,829.10**	**21,468.70**	**33,824.50**

6.2 Environmental Governance and Regulations

Environmental governance refers to the decision-making processes involved in the control and management of the environment and natural resources. It is a system of laws, norms, rules, policies, and practices that dictate how regulatory bodies should manage and oversee the affairs of any environment-related regulatory body responsible for ensuring sustainability and managing all environmental resources. Kenya is a member of and participates in standards development and related activities of International Organizations for Standardization (ISO). The fields of standardization cover the following: Food, agriculture, chemical, environment, electrical/electronic engineering, metrology (measurement) standards, textile, leather, bamboo products, and other service sectors including health, education and tourism. Some of the benefits of standardization is to drive efficiency in business operations and reduce waste and environmental pollution as well as provide best practices, performance and safety reference points for regulators, researchers and industry. The lead agency for Standardization is the Kenya Bureau of Standards (KEBS) that works closely with other environmental protection, conservation and regulartory agencies to ensure quality of products and strengthen environmental governance.

The government has policy elements at National and County levels (Nairobi, Mombasa, Nakuru and Kisumu Cities). For the Cities, policy elements include: Combustion of fossil fuels, protection of water catchment areas, and climate financing while the National Government has water harvesting and storage, fforestation and reforestation, emission limit and target, collaboration and partnerships. Others are Natural disaster, clean environment, biodiversity conservation and infrastructure resilience. On smart governance, policy elements include public private partnership initiatives, multi-sector collaboration, transparent governance, e-government models, platforms and services e.g. Common Government services Paybill 222222.

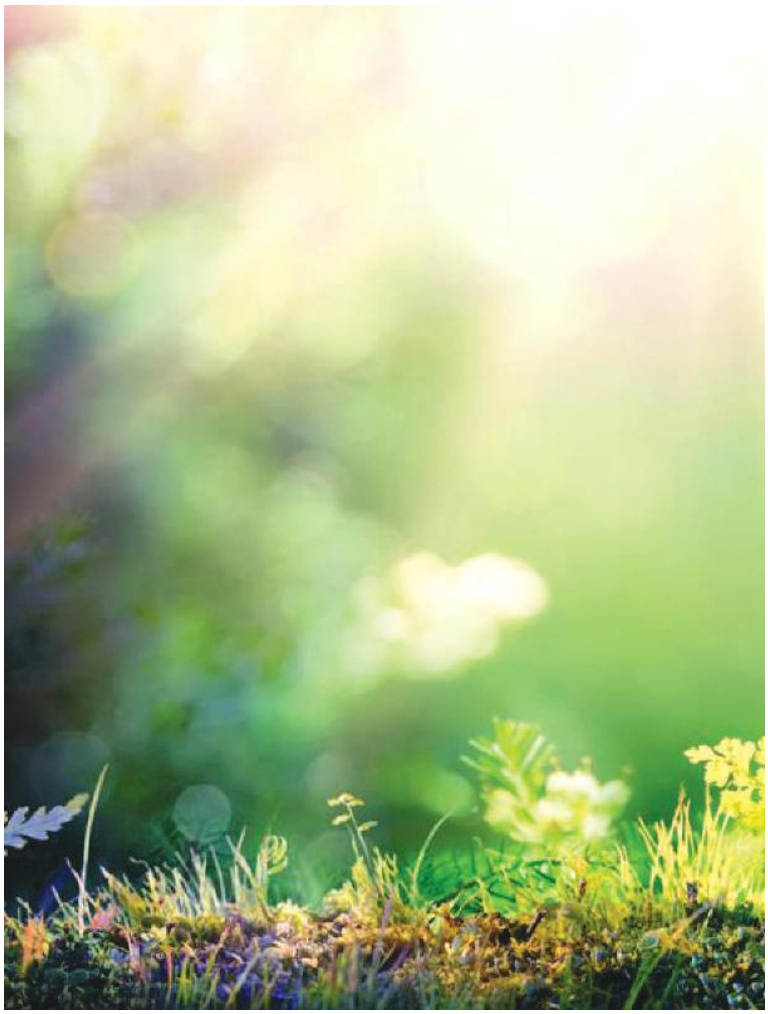
The Kenya Environmental law describes the legal rules in

Kenya relating to the environment, and more broadly the social, economic, philosophical and jurisprudential issues raised by attempts to protect, conserve and reduce the impacts of human activity on the Kenyan environment. They include the following;

1. **Environmental Management and Coordination (Waste Management Regulations 2006):** These Regulations apply to all categories of waste. These include: industrial waste, hazardous and toxic waste, pesticides and toxic substances, biomedical waste and radio-active substances. These regulations outline requirements for handling, storing, transporting, and treatment/ disposal of all waste categories. The regulations make provisions for disposal of waste by NEMA licensed companies.

2. **The Environmental Management and Coordination (Wetlands, Riverbanks, Lakeshores, And Seashores Management Regulations 2009):** This regulation seeks to ensure wetland resources are utilized in a sustainable manner compatible with the continued presence of wetlands and their ecological goods and services. The sustainable use of wetlands should be integrated into the national and local land use plans to ensure sustainable use and management of the resources. The main purpose is to provide for the conservation and sustainable use of wetlands and their resources in Kenya. Environmental Impact Assessment and Environmental Audit as required under the EMCA shall be mandatory for all activities likely to have adverse impact on the management of wetlands.

3. **The Environmental (Impact Assessment and Audit) Regulations, 2003:** Environmental Impact Assessment (EIA) is a critical examination of the effects of a project on the environment. The EIA must be conducted before the commencement of the project. The goal of an EIA is to ensure that decisions on proposed projects and activities are environmentally sustainable. It guides policy makers, planners, stakeholders and government agencies to make environmentally and economically sustainable decisions. It is therefore a legal requirement to carry out an EIA before commencement of the project. The EIA process requires that a proponent shall seek views of persons who may be affected by the project. The proponent shall be issued with an EIA license before commencement of the project.



4. **Environmental Audit (EA):** This is the systematic documentation, periodic and objective evaluation of activities and processes of an ongoing project. The purpose of EA is to determine the extent to which the activities and programs conform to the approved environmental management plan.

5. **Environmental Management and Co-ordination (Water Quality) Regulations, 2006:** This regulation applies to water used for domestic, industrial, agricultural, and recreational purposes; water used for fisheries and wildlife purposes, and water used for any other purposes. Different standards apply to different modes of usage. These regulations provide for the protection of lakes, rivers, streams, springs, wells and other water sources. The objective of the

regulations is to prohibit discharge of effluent into the environment contrary to the established standards. The regulations further provide guidelines and standards for the discharge of poisons, toxins, noxious, radioactive waste or other pollutants into the environment.

6. **Environmental Management and Co-ordination (Controlled Substances) Regulations, 2007:** These Regulations aim to regulate the production, trade and use of controlled substances and products; provide for a system of data collection to facilitate compliance with relevant reporting requirements under the Montreal Protocol on Substances that Deplete the Ozone Layer; promote the use of ozone friendly substances, products, equipment and technology; and ensure the elimination of substances and products that deplete the ozone layer.

7. **The Environmental Management and Co-Ordination (Conservation of Biological Diversity and Resources, and Access to Genetic Resources and Benefits Sharing) Regulations, 2006:** The regulations were developed to protect biological diversity and resources. These Regulations apply to access to genetic resources or parts of genetic resources, whether naturally occurring or naturalised, including genetic resources bred for or intended for commercial purposes within Kenya or for export, whether in in-situ conditions or ex-situ conditions. They do not apply: to plants listed in the Agriculture Act Cap 318; the exchange of genetic resources where the exchange is done

by a local community among themselves and for their own consumption; or where the exchange is certified to be purely for food or other consumptive purposes as prescribed by the relevant laws.

8. **The Environment Management and Co-Ordination (Air Quality) Regulations:** The objective of the Regulations is to provide for prevention, control and abatement of air pollution to ensure clean and healthy ambient air. It provides for the establishment of emission standards for various sources such as mobile sources (e.g. motor vehicles) and stationary sources (e.g. industries) as outlined in the Environmental Management and Coordination Act, 1999.

9. **The Environment Management and Co-Ordination (Noise and Excessive Vibration Pollution) (Control) Regulations, 2009:** These Regulations aim at ensuring the maintenance of a healthy environment for all people in Kenya; the tranquillity of their surroundings and their psychological wellbeing by regulating noise levels and excessive vibration. The Regulations elevate the standards of living of the people by prescribing acceptable noise levels for different facilities and activities and provide for the control of noise and mitigating measures for the reduction of noise.

10. **Note:** The above EMCA Regulations are currently undergoing revision in the financial year 2023/2024.

6.2.1 Institutional Strengthening

The Environment and Land Court is a superior court established by Article 162(2) of the Constitution of Kenya. The Environment and Land Court Act no.19 of 2011 (ELCA) gives effect to Article 162(2) of the Constitution and the court was established to hear and determine disputes relating to the environment and the use and occupation of, and title to land. The court exercises jurisdiction throughout Kenya. The court has powers to deal with disputes relating to land administration and management. It is also empowered to hear cases relating to public, private and community land and contracts, choses in action or other instruments granting any enforceable interests in land.

Institutions Established under the Environmental Management and Coordination Act (EMCA), No.8 1999

In Kenya, Environmental Management and Co-ordination Act (EMCA 1999), is an overaching legal document for the protection and management of the environment. EMCA 1999 was revised in 2015 to align it to the Constitution of Kenya 2010 after devolution of environmental issues to the County Government. The Act provides for the establishment of an appropriate legal and institutional framework for environmental management. The Act is undergoing review in the current financial year 2023/2024.

1. **National Environmental Management Authority (NEMA)** is mandated to exercise genral supervision and coordination over all matters related to the environment. It is further mandated to be the principal instrument of government in implementation of all policies relating to the environment. Following the Constitution of Kenya, 2010 it has presence in 47 Counties and the NEMA Headquarters in Nairobi. However, some of the counties are too large for NEMA's regulartory services and stakeholder collaboration hence requiring more staff to be appointed and deployed to the Sub – Counties. NEMA is using Information Communiation Technology and Geographical Information Systems (GIS) to automate environmental licencing and compliance as well as upsacling its services across the country.

2. **National Environment Tribunal (NET):** The National Environment Tribunal is established under Kenya's Framework Environment Law to receive, hear, and decide appeals arising from decisions of the National Environment Management Authority on issuance, denial, or revocation of environmental impact assessment licenses, among other issues.

3. **County Environment Committees (CECs):** The CECs are the principal avenues through which County Governments formulate policies, strategies and plans on the implementation of their devolved environmental functions. These functions include: County Health Services that include refuse removals, refuse dumps and solid waste disposal; Control of air pollution, noise pollution, and other public nuisance; implementation of national government policies on natural resources and environmental conservation including soil & water conservation and forestry. Devolved Environmental Functions obligated to

Counties under the Environmental management and Coordination Act, 1999 include the following:

a) The County Environment Committee shall be responsible for the proper management of the environment within the county for which it is appointed

b) The County Environment Committee shall develop a County Strategic Environmental Action Plan every five years

c) The respective County Executive Committee members of every county shall submit the county environment action plan referred to in subsection (1) to the Cabinet Secretary for incorporation into the national environment action plan referred to in section

d) Every County Environment Committee shall identify the hilly and mountainous areas under their jurisdiction which are at risk from environmental degradation

e) Each County Environment Committee shall notify the Authority of the hilly and mountainous areas it has identified as being at risk from environmental degradation under subsection

f) Every County Environment Committee shall specify which of the areas identified in accordance with section 45(1) are to be targeted for afforestation or reforestation

g) Every County Environment Committee shall take measures, through encouraging voluntary self-help activities in their respective local community, to plant trees or other vegetation in any area specified under subsection (1) which are within the limits of its jurisdiction

h) Where the areas specified under subsection (1) are subject to leasehold or any other interest in land including customary tenure, the holder of that interest shall implement measures required to be implemented by the County Environment Committee including measures to plant trees and other vegetation in those areas

i) The County Environment Committee shall be responsible for ensuring that the guidelines issued and measures prescribed under subsection (2) in respect of their counties are implemented

j) Any person who contravenes any measure prescribed by the Authority under this section or who fails to comply with a lawful direction issued by a County Environment Committee under this section shall be guilty of an offence (CEC can issue lawful direction to 47.3, and it is an offence not to comply)

k) A County may make legislation in respect of all such matters as are necessary or desirable that are required or permitted under the Constitution and this Act.

l) Contribute to decentralization of environmental management and enable participation of local communities.

4. **National Environmental Complaints Committees (NECC)**: It is the body charged with the task of investigating complaints or allegations regarding the condition of the environment in Kenya and suspected cases of environmental degradation. The NECC also undertakes public interest litigation on behalf of the citizens in environmental matters hence provides the administrative mechanism for addressing environmental harm.

5. **National Environment Trust Fund (NETFUND)**: It collaborates and partners with stakeholders in the mobilization of financial and technical resources through development of bankable proposals for environmental management and promotion of best practices in the environment sector. Best practices are recognized at individual, corporate and industry levels through an environmental award scheme. Other forms of support include award of scholarships and grants, capacity building and environmental publications to create environmental awareness and education. NETFUND hosts conferences, trade fairs, commemoration of environmental days

6.2.2 Environmental Regulations and Instruments

The regulations prohibit certain forms of pollution and give guideline on levels of pollution that are permissible.

Table 6.2: List of Regulated Pollutants

Name of regulated pollutants	Description	Remarks
Pesticides: aldrin, chlordane, DDT, dieldrin, endrin, heptachlor, hexachloro-benzene, mirex, toxaphene;	2004. banning or sever restriction	For Unintentionally produced Pops ensure Minimization of emissions
Industrial chemicals: hexachlorobenzene, polychlorinated biphenyls (PCBs); and		
By-products: hexachlorobenzene; polychlorinated dibenzo-*p*-dioxins and polychlorinated dibenzofurans (PCDD/PCDF), and PCBs.

6.2.3. Participation in Multilateral Environmental Agreements (MEAs) and Environmental Conventions.

International Treaties and Agreements. Kenya is a party to many international treaties, agreements and protocols on biodiversity, ecosystems and the environment. Multilateral Environmental Agreements are internationally negotiated and agreed upon environmental governance instruments and treaties. They are vital in the general environmental protection, conservation and management especially in the face of environmental challenges against the backdrop of globalisation. These challenges include: uncontrolled growth in the context of inadequate governance; competitiveness problems; rising energy demand and climate change; the spread of invasive alien species; the spread of consumerism and cultural diversity loss; and concentration of power, information and financial resources and enhancing communication possibilities.

Kenya is a signatory to the following international conventions and protocols that address environmental challenges:

Table 6.5: Multilateral Environment Agreements (MEAs) Ratified, Signed and Acceded by Kenya

No.	Name of the meas/any other global convention	Description	Date of signing/ratification
1	African Convention On The Conservation Of Nature And Natural Resources, 1969		Signed1968, Ratification/Accession 1969
	Agreement On The Application Of Sanitary And Phytosanitary Measures (Sps) And Agreement On Technical Barriers To Trade (Tbt), 2000		Party 1995
	Agreement On The Conservation Of African-Eurasian Migratory Waterbirds, 2010		Party 2001
	Bamako Convention On The Ban Of The Import Into Africa And The Control Of Transboundary Movement And Management Of Hazardous Wastes Within Africa, 1991		Signed 2003
2	Basel Convention On The Control Of Transboundary Movements Of Hazardous Wastes And Their Disposal, 1989		Accepted 2000
	Convention For The Protection Of The Ozone Layer, 1994		Accession 1988
	- Montreal Protocol, 1989		Ratification 1988
	Convention Of The Protection, Management And Development Of The Marine And Coastal Environment Of The Eastern African Region, Nairobi, 1985/ Amended Nairobi Convention For The Protection, Management And Development Of The Marine And Coastal Environment Of The Western Indian Ocean, 2010		Convention of 1984: Ratified 1990, Amendment signed 2010
	- Protocol For The Protection Of The Marine And Coastal Environment (Lbsa Protocol), 2010		Signed 2010

Table 6.5: Multilateral Environment Agreements (MEAs) Ratified, Signed and Acceded by Kenya *(Continued)*

No.	Name of the meas/any other global convention	Description	Date of signing/ratification
	- Protocol Concerning Protected Areas And Wild Fauna And Flora In The Eastern African Region, 1985		Signed 1985
	- Protocol Concerning Co-Operation In Combating Marine Pollution In Cases Of Emergency In The Eastern African Region, 1985		Signed 1985
	- Protocol For The Protection Of The Marine And Coastal Environment Of The Western Indian Ocean From Land-Based Sources And Activities, 2010		Signed 2010
	United Nations Convention On Biological Diversity (Cbd), 1992		Ratified 1994

The following is a thematic illustration on each specific environmental problem addressed and the relevant Multilateral Environmental Agreement.

- **Air:** -Geneva Convention on Long-Range Transboundary Air Pollution (CLRTAP) (1979) and its protocols.
- **Biotechnology:** Cartagena Bio Safety Protocol (2000) to the Rio Convention on Biological Diversity (1992).
- **Chemicals:** Rotterdam Convention on Prior Infirmed Consent (PIC) 1998, Stockholm Convention on Persistent Organic Pollutants- POP (2001), Minamata Convention on Mercury (2013).
- **Climate Change and Ozone Depletion:** Framework Convention on Climate Change (1992) and Kyoto Protocol (1997),Vienna Convention for the Protection of the Ozone Layer (1985) and the Montreal Protocol as amended.
- **Industry:** Helsinki Convention on Industrial Accidents (1992).
- **Nature and Biodiversity:** Convention on Biological Diversity (1992), Convention on Wetlands of International Importance (RAMSAR) (Kenya has signed and ratified the Convention).
- **Soil:** UNCCD Convention to Combat Desertification (1994). (Kenya signed the Convention in 1994 and ratified in 1997)
- **Waste:** Basel Convention on Hazardous Wastes (1989) (Kenya signed and assented to the Convention in the year 2000)
- **Water:** Helsinki Convention on Watercourses and International Lakes (1992)

6.2.4. Environmental Impact Assessment

Environmental Impact Assessment (EIA) is a process of evaluating the likely environmental impacts of a proposed project or development, taking into account inter-related socio-economic, cultural and human-health impacts, both beneficial and adverse.

The Environment Management and Coordination Act provides for Environment Impact Assessment before any major developments are undertaken that have a bearing on natural resources and the environment. Table 6.7 shows the EIAs by sectors from 2015 to 2023.

Table 6.7: Number of Environment Impact Assessments(EIA) by Sector, 2015-2023

Sector	2015	2016	2017	2018	2019	2020	2021	2022	2023

6.2.5. Other Legal Frameworks

Constitution of Kenya 2010

The enactment of the 2010 Constitution of Kenya marked an important chapter in Kenya's environmental policy development. Hailed as a "Green" Constitution, it embodies provisions to secure future sustainable development, ranging from the environmental principles of Multilateral Environmental Agreements (MEAs) to the right to a clean and healthy environment, including water, food, and shelter.

Kenya's commitment to sustainable environment and environmental management is clearly expressed in its new 2010 Constitution. Chapter Five addresses land and environment and Articles 66, 69, 70, 71, and 72 are dedicated to environmental and natural resource management (ENRM) issues. The chapter highlights the importance of sound conservation and protection of ecologically sensitive areas and the elimination of gender discrimination in land and environment management practices. In addition, Article 69 details the obligations on the state to implement the sustainable exploitation, utilization, management, and conservation of the environment and natural resources, and equitable sharing of benefits accruing from such.

Vision 2030

Vision 2030 provides Kenya with a development blueprint covering the period between years 2008 to 2030 and implemented in five-year medium-term plans. It aims to transform Kenya into a newly industrialized middle-income country in which citizens enjoy a high quality of life in a clean and secure environment. Vision 2030 recognizes that the environment and natural resources (ENR) are critical to achieve the socioeconomic and political development objectives that it sets out. It consists of three pillars.

(1)The economic pillar ,aimed at maintaining a sustainable economic growth of 10 percent per annum over the years covered in the blueprint.

(2)The social pillar ,aimed at ensuring a just and cohesive society that enjoys equitable social development in a clean and secure environment and

(3)The political pillar aimed at ensuring an issue-based, people-centered, and result-oriented democratic political environment.

National Environment Policy (2013)

The National Environment Policy, adopted in 2013, aims to enhance the ecological perspective and strengthen the connections between green policy and poverty reduction. The three main objectives of the policy are to:

(1)Ensure sustainable management of Kenya's environment and natural resources.

(2)Provide a framework for an integrated approach to planning and sustainable management of the environment and natural resources.

(3)Strengthen the legal and institutional framework for good governance, and effective coordination and management of the environment and natural resources.

The National Environment Policy promotes and enhances cooperation, collaboration, synergy, partnerships, and participation in the protection, conservation, and sustainable management of the environment and natural resources.

6.2.6. Conclusion

This chapter organizes information on environmental protection and resource management expenditure to improve the environment and maintain ecosystem health. Statistics on environmental governance, institutional strength, enforcement of regulations and extreme event preparedness are also considered. This component also includes information on a wide variety of programmes and actions to increase awareness, including environmental information and education, as well as private and community activities aimed at diminishing environmental impacts and improving the quality of local environments. The last chapter presents the embition of Kenya , challengers and future plan for developing environment statistics.

07

AMBITION OF KENYA, CHALLENGES AND FUTURE PLANS FOR DEVELOPING ENVIRONMENT STATISTICS

7.0. Introduction

The Kenya Vision 2030 specifies that the country aims to be a nation that has a clean, secure and sustainable environment by 2030 by;

(i) Increasing forest to a minimum of 10% by 2030; and
(ii) Reducing by half all environment-related diseases.

Specific strategies should promote environmental conservation in order to provide better support to the economic pillar flagship projects and for the purposes of achieving the SDGs; improving pollution and waste management through the design and application of economic incentives; and the commissioning of public-private partnerships (PPPs) for improved efficiency in water and sanitation delivery. Kenya should also enhance disaster preparedness in all disaster -prone areas and improve the capacity for adaptation to global climatic change. In addition, the country should harmonise environment-related laws for better environmental planning and governance. However, to reach these objectives statistics are needed on the status of environment. To support Kenya's ambitions,international agencies and organisations such as UNSD, EAC, Secretariat and Statistics Sweden (SCB) and COMESA provided some funds for implementing the (FDES 2013) wich is a flexible, multi-purpose conceptual and statistical framework that is comprehensive and integrative in nature. The FDES provides an organizing structure to guide the collection and compilation of environment statistics at the national level. It brings together data from the various relevant subject areas and sources. It is broad and holistic in nature, covering the issues and aspects of the environment that are relevant for policy analysis and decision making.

7.1. Results of Online assessment

An online assessment done in november 2022 by using of the Environment Statistics Self Assessment Tool(ESSAT), Kenya implemented the FDES by only two out of four crtical phases were completed namely :Preparatory Stage and Foundational stage as showed the table below. Noted that the same assessment revealed that data are stored in databases.

Table 7.1: Countries at the Different Critical Phases of Implementation

Country	preparatory stage	Foundational stage	Operational stage	Consolidation stage
Liberia	No	No	No	No
Ethiopia	Yes	Yes	No	No
Malawi	Yes	Yes	No	No
Ghana	Yes	Yes	Yes	Yes
Kenya	Yes	Yes		
Gambia	Yes	yes	Yes	Yes
Sudan	Yes	Yes	Yes	Yes
Lesotho	Yes	Yes	Yes	Yes
Somalia	No	No	No	No
Siera Leone	No	No	No	No
Zambia	Yes	Yes	Yes	No
Rwanda	Yes	Yes	Yes	No
Zimbamb-we	Yes	Yes	yes	Yes
Uganda	Yes	Yes	yes	Yes

Source: *Environment Statistics Self Assessment Tool(ESSAT)*

1. The preparatory stage concerns the creating of a national team, establishing the leadership and responsibilities; establishing the modes of collaboration with other institutions and within each institution; reviewing of the legal framework, mandate and national policy priorities related to the environment, information and development; establishing policy and user needs; developing of a national strategy for establishing an environment statistics programme; reviewing of methodological resources, available in appropriate languages and including the FDES and the Core Set of Environment Statistics.
2. Foundational Stage concerns the assessment of data availability and sources for producing environment statistics at the national level; applying the Self-Assessment tool based on the Core Set of Environment Statistics to identify possible data gaps that are important to the country; engaging in technical capacity building activities such as training, study tours and workshops; formalizing and supporting inter- and intra-institutional collaboration mechanisms and focal points and defining the environment statistics product(s) mostly required within a long-term timeframe.
3. Operational Stage regarding the adaptation the FDES and the Core Set of Environment Statistics to the country's needs and priorities; defining a set of environment statistics to be produced at the national level; developing collaboration with national scientists and experts on specific realms of the environment to consult as needed; developing data compilation and collection instruments and undertaking these processes;carrying out data validation;developing metadata;preparing publications; preparing launch events;disseminating environment statistics products and obtaining feedback.
4. Consolidation Stage concerns the institutionalization and strengthening of environment statistics units; formalizing national inter-institutional collaboration platforms; allocating budget and staff resources dedicated to environment statistics; connecting with and participating in regional and global expert groups, networks and resources; maintaining and further developing environment statistics' coverage and timeliness and ensuring statistical quality.

This completed first edition of the compendium allows to Kenya to achieve the third stage regarding the Operational Stage. Although Kenya is yet compile all these fours phases, the countriy has the inter-institutional working group to coordinate the production of Environment Statistics under the coordination of KNBS jointly with NEMA.

Table 7.2: Countries with Committee, Inter-institutional Working Group on Environment Statistics

Country	Yes or No	Country	Yes or No
Anglophone		Lesotho	Yes
Liberia	No	Somalia	No
Ethiopia	No	Siera Leone	Yes
Malawi	Yes	Zambia	No
Ghana	Yes	Rwanda	No
Kenya	Yes	Zimbambwe	Yes
Gambia	Yes	Uganda	Yes
Sudan	Yes		

Source: *Environment Statistics Self Assessment Tool(ESSAT)*

7.2. Challenges

As other countries, Kenya is faced with several barriers to collaboration among institutions, for the production of Environment Statistics. The main barriers faced by kenya are: the lack of finance for the functioning of the committee , the lack of resources for regular meetings and the overlapping responsibilities of institutions.

7.3. Way forward

Kenya have at least initiated the implementation of the FDES. Currently, it is needed to:

1. Update the Technical Working Group for covering all institutions involved in the productions of environment statistics,
2. Initiate the implementation of the global set of climate change statistics and indicators by producing the report on climate change statistics ,
3. Review the National Strategies for the Development of Statistics by including the environment and climate change statistics,
4. Elaboration of methodologies,
5. Join the development partners, requesting the technical support on the environment and climate change statistics and on the related areas such as diseasters related statistics. The support will be oriented in (capacity building , trainings, including e-training, and study tours, regular meeting, data collection etc).

Annex 2: Environment and Natural Resources Sector- Outcome and Output indicators

(a) Outcome Indicators

Outcome	Indicators	Unit	Baseline Year	Baseline/ Values	Targets		Data Source	Responsible Agency	Link to SDG
					2023/24	2027/28			
Reduced GHG Emissions	GHG Emission per year	CO2eMt	2022/23	98	97	90	Nationally Determined Contributions (NDCs) Report	SDECC	13
Improved sustainability of environmental Ecosystems	Area of mountain ecosystems sustainably conserved and managed	Hectares	2022/23	940,576	940,576	940,576	Kenya Forest Service (KFS) Annual Progress Reports	MECCF	15.4.1, 15.4.2
	Area of inland freshwater ecosystems and wetlands protected	Acres	2022/23	11	10	7	NEMA Annual Progress Reports	MECCF	15.1.2
	Area of land reclaimed	Hectares	2022/23	17,101	18,000	20,000	KWTA Annual Progress Reports	MECCF	15.4.1
	Area of water towers rehabilitated/ protected	Hectares	2022/23	142,601	142,601	300,000	KWTA Annual Progress Reports	MECCF	15.3
	Proportion of degraded landscapes restored (2.6 million Ha)	%	2022/23	-	4	20	KFS progress report	MECCF	15.3.1
Riparian areas rehabilitated and protected	Length of riparian reserves rehabilitated	KM	2022/23	100	100	100	NEMA Annual Progress Reports	SDECC	15
Improved Social Inclusion and sustainable livelihoods	Green jobs created	No.	2022/23	2,700	20,000	20,000	KFS progress report	MECCF	8.3.1, 8.9.2, 9.2.2
Improved solid waste management countrywide	Quantity of solid waste collected	Tonnes	2022/23	0	20	60	NEMA Annual progress reports	SDECC	11.6.1
	County dumpsites with ten minimum points established	No.	2022/23	1	4	10	NEMA Annual Progress Reports	NEMA	11.6.1
	Landfill/wastes disposal sites screened for climate change impacts	No.	2022/23	0	1	1	NEMA Annual Progress Reports	SDECC	13.2.2.2
Improved sustainability of forest related Ecosystems	Tree cover	%	2022/23	12.13	12.92	21.07	KFS Annual Progress Reports	KFS, SDF	15.1.1
	Forest cover	%	2022/23	8.83	10	17	KFS Annual Progress Reports	KFS, SDF	15.1.1
	Area of land covered by invasive species managed	Hectares	2022/23	10,000	2,000	2,000	KFS Annual Progress Reports	KFS SDF	15.8.1
	Development of forest and allied natural resources technologies	No. of technologies developed	2022/23	200	40	40	Kenya Forestry Research Institute (KEFRI) Annual Progress Reports	KEFRI	15

(b) Output Indicators

Priority Project	Output	Indicator	Targets		Lead Agency	Supporting Agency
			2023/24	2027/28		
National Tree Growing and Restoration Programme	500 tonnes of tree seeds collected, processed and distributed	Quantity of seeds (Tonnes)	100	100	KEFRI	SDF
	5 billion Tree seedlings produced	No. of tree seedlings (Billions)	0.6	1.2	KFS	SDF
	3.5 million Ha of degraded forests areas and landscape, rehabilitated thro protection of natural regenerations and planting (5.2 billion seedlings)	Area rehabilitated (Million Ha	0.3	1.0	SDF	SDF
	Trees planted (70% survival rate is assumed)	No. of Trees (Billions)	1	2	SDF	MECCF
Agroforestry woodlots in ASALs	1 million Ha of Agroforestry developed in 23 ASAL Counties; (Melia woodlots, gums & resins, sandalwood etc.)	Area (Ha) rehabilitated	50,000	350,000	KFS	SDF
Sustainable "green" charcoal value chain and alternative domestic energy	Draft charcoal regulations gazetted and operationalized	No. of regulation gazetted	1	0	SDF	MECCF
	Sensitization regional meetings for law enforcement agencies on implementation of charcoal regulations to decriminalize production and trade in charcoal and charcoal products, conducted.	No. of regional sensitization meetings conducted	1	2	SDF	MECCF
	300 Charcoal Producers Associations (CPAs), established and supported, on adoption of efficient technology, branding and marketing	No. of CPAs established and strengthened	300	300	KFS	SDF, CGs
	500 youth groups supported and mentored in briquette charcoal production enterprise	No. of youth groups supported & mentored	50	110	KFS	KEFRI, SDF, MECCF
	2,500 public schools and institution transit to adoption and use LPG	No. of schools and institutions	500	500	SDP	SDF, MECCF
Modernization and commercialization of the charcoal value chain	Clean cooking technologies adopted	No. of clean cooking technologies adopted	2	2	MECCF	SDF
Waste management infrastructure	Waste Collectors cooperatives registered	No. of Waste cooperatives	20	14	NEMA	MECCF
	Waste Material Recovery Facilities constructed in all Counties	No. of Waste Material Recovery Facilities	5	100	MECCF	NEMA Counties
	Community-Based/ owned plastic recycling value chain established	No. of plastic recycling value chains	200	350	NEMA	MECCF
Pollution Management	Waste service providers trained on waste recovery	No. of service providers trained	10	10	SDECC	NEMA
	Air quality in 6 urban areas monitored	No. of air quality reports	5	5	SDECC	NEMA
Thwake River Upstream Clean up Pollution Control and Catchment Management	Effluent discharges and solid waste flow in the Athi-Galana-Sabaki river system reduced.	% of illegal dump sites along the river removed	20	75	SDECC	NEMA
	Length of riparian area of areas of Athi-Galana-Sabaki river system rehabilitated	KM of riparian areas rehabilitated	100	100	SDECC	SDARD SDF
Climate Change Finance	Carbon market frameworks and regulations developed	Framework and regulations	1	-	SDECC	TNT
	Amount of revenue raised from carbon market	Kshs. Billions	1	1	SDECC	TNT
	Amount raised from green and blue bonds	Kshs. Billions	1	0	SDECC	TNT

Priority Project	Output	Indicator	Targets		Lead Agency	Supporting Agency
			2023/24	2027/28		
Wildlife Conservation and Management	Anti-poaching of illegal trade in wildlife enhanced	No. of threatened and endangered species protected	25	70	KWS	SDW
	Area of wildlife habitats restored	Ha of habitats restored	25	770	KWS	SDW
	Modern security equipment, technologies, mobile service vehicles acquired	No. of new technologies/ modern equipment and mobile vehicles acquired	381	-	KWS	SDW
	GoK parks and reserves fences constructed / rehabilitated/maintained	Km of fences constructed/ rehabilitated/maintained	730	360	SDW	KWS TNT
	Human wildlife conflict claims disbursed	% of verified Human wildlife compensation claims settled	100	100	KWS	SDW TNT
	Human-wildlife conflict insurance scheme operationalized	HWC Insurance scheme	2	2	SDW	KWS TNT
Wildlife Revenue	Revenue management systems digitized in all parks	% of operationalization	8	34	KWS	SDW
	Guest houses, bandas and tented camps leased	No. of guest houses, bandas and private camps leased	5	-	KWS	SDW
Green and Blue Jobs initiatives	Women and youth tree nursery associations registered	No. of youth and women associations	8,348	8,350	SDW	SDF
	Additional wildlife rangers recruited	No. of rangers recruited	1500	-	KWS	SDW
	Contracts for community wildlife scouts renewed	No. of community scouts	1,100	1,100	SDW	KWS
	People employed to plant and grow trees	No. of people employed No. of people employed	800	800	SDW	SDW
	Community Forest Guards recruited	No. of Community Forest Guards recruited	2,800	-	KFS	SDF
	Fishing crew trained	No. of fishing crew trained	1,000	1,000	SDBEF	SDW
	Youth reskilled on STCW courses and placed on international ships	No. of youths	600	600	SDW	SDW
	Youth trained on Climate adaptation under the Kenya Green Army	No. of youth trained	200,000	200,000	MECCF	SDYA
	Hospitality graduates placed on jobs abroad annually	No. of graduates placed	20	20	MOFDA	MoTW SDL
	Charcoal associations registered	No. of charcoal associations registered	2,000	2,000	SDF	SDC
Tourism and Wildlife Training and Research	KUC upgraded and modernized	% completion	20	100	Kenya Utalii College	SDT
	Ronald Ngala Utalii College phase 2 completed	% completion	0	55	Tourism Fund (TF)	SDT
	Kisumu Hospitality and Tourism Training College established	% completion	20	100	TF	SDT
	Wildlife Research and Training Institute infrastructure developed	% completion	48	-	TF	SDW
	Wildlife Research Centers constructed and equipped	No. of wildlife research centers constructed and equipped	0	-	SDW	KWS, WRTI
	National Integrated Wildlife Database developed	Operational wildlife database	1	-	SDW	KWS, WRTI
Tourism Niche Experiences	Sports Safari events held	No. of Sports Safari events held	7	7	SDS	MTW
	Forest tourism products developed (Adventure, Camping and Bird Watching)	No. of Circuits developed	1	1	SDT	SDF

Priority Project	Output	Indicator	Targets		Lead Agency	Supporting Agency
			2023/24	2027/28		
Inclusive Nature Tourism Beaches	Beach operators Sacco established	No. of Saccos	0	0	SDT	MSMFEs
	Cruise terminus constructed	Operational cruise terminus	-	1	MTW	MMPE&MA
	Kisumu Lake front Redesigned and developed	% completion	-	100	MTW	MMPE&MA
	Mombasa Aquarium Theme Park developed	% completion	-	100	SDT	MTW
	Mama Ngina Waterfront Phase II completed	% completion	-	100	SDT	MTW
Wildlife (Safari) Products	Signature parks revamped	No. of signature parks revamped	1	1	KWS	MTW
	Marine parks ecosystem and infrastructure rehabilitated	No. of marine parks rehabilitated	1	1	KWS	MTW
	New tourism products developed	No. of new products developed	2	2	KTB	MTW
	Parks repositioned and themed	No. of parks repositioned and themed	2	2	KWS	MTW KTB
Business and Conference Tourism	Conferences held	No. of Conference participants	11,614	16,863	MTW, KICC, KNCB	MTW
	KICC refurbished and modernized	% completion	79	-	KICC	MTW
	MICC constructed	Operational MICC	1	-	MTW	KTB
	Great Rift Convention Centre constructed	Operational Great Rift Convention Centre	1	-	SDT	MTW
Resort Cities	Land acquired	Hectares of land acquired	400	189	LAPSSET	Lamu, Isiolo and Turkana County Governments
Tourism Revenue promotion	Affordable and secure accommodation regulated	% completion	-	100	SDT	KTB
	Desert and pastoral tourism circuits promoted and commercialized	No. of tourism circuits	8	8	SDARD	SDT
	Kenya Safari TV channel operationalized	Operational TV	-	-	SDT	SDW, SDCH, SDS
	Targeted consumer engagement programmes developed	No. of programmes	4	4	SDT	SDW, SDCH SDS
	Tourism desks established at foreign missions	No. of tourism desks	-	4	SDT	MFDA
	Key and emerging source markets reactivated	No. of new markets	2	2	SDT	MFDA
	Marketing materials developed and translated in six foreign languages	No. of marketing materials translated into foreign languages	-	-	SDT	MFDA
Tourism Promotion and Marketing	Brand awareness created	Brand awareness Index	30	-	KTB	MTW
	Priority markets reached	No. of Priority markets reached	2	4	MTW	KTB
	African markets source Diversified	No. of Tourism from African region	20	40	KTB	MTW MFDA
	Tourism desks established in foreign missions	No. of tourism desks established	-	2	MFDA	KTB
	Marketing and promotional media contents developed	No. of Marketing and promotional media contents developed	2	3	KTB	MTW

Priority Project	Output	Indicator	Targets		Lead Agency	Supporting Agency
			2023/24	2027/28		
Conservation of Culture and Heritage	Insect farming Promotion in ten (10) Counties	No. of insect farms established	1	4	NMK	SDCH
	Meliponi culture and apiculture farms established	No. of farmers trained and supported	200	200	SDCH	CGs
		No. of meliponiculture and apiculture farms established	1	5	NMK	SDCH
	Mushroom farms established	No. of Mushroom farms established	1	1	SDCH	CGs
	Production of under-utilized indigenous food crop revitalized	No. of farmers trained and supported	500	900	NMK	SDCH
	Cultural practitioners trained	No. Cultural practitioners trained.	10	10	SDCH	CGs
	Cultural exchange programmes	No. of Cultural exchange programmes undertaken	1	4 SDCH	NMK	SDCH
	Indigenous languages Mapped and documented	No. of Indigenous languages Mapped and documented	1	1	SDCH	CGs
	Integrated National Cultural and Creative Industries Information Management System established	% establishment	20	100	SDCH	SDICT&DE
	National Arts Gallery Established	% completion	50	-	SDCH	NMK
	Development of Sanaa App (Cultural e-commerce Platform	% completion	10	100	SDCH	SDICT&DE
	Patriotism, integration and cohesion promoted;	No. of artists participating in the festival	200	200	SDCH	SDT CGs
	Capacity Building & Production Tools for 10 Counties	No. of people capacity build	3,000	3,000	SDCH	CGs
	Establishment of Kenya Heroes Fund	Kshs. Million	-	300	SDCH	TNT
Underwater Natural Resources	Underutilized marine and freshwater aquaculture resources domesticated and commercialized	No. of oyster species (Pearl), snail and prawn farms established	1	4	NMK	SDCH
		No. of aquaculture resources products commercialized	1	1	NMK	SDCH
Natural Product Industry Initiative	Indigenous Knowledge Management System developed	% of operationalization	20	100	NMK	SDCH
	A national and 47 County digital repositories established	No. of Digital repositories established	5	12	NMK	SDCH
	Cottage industries established	No. of cottage industries	1	1	SDCH	NMK
	The Innovation Bank of Kenya established	% of establishment Innovation Bank of Kenya	20	100	NMK	SDCH
Promotion of culture and heritage tourism	Cradle of humankind Parks Developed	No. of Parks developed	2	5	NMK	SDCH
	Best Monuments identified and developed.	No. of monuments identified and developed.	10	31	NMK	SDCH
	Malindi Gede Ruins Complex reconstructed	% completion	20	100	CGs	SDCH
	Old PC's office in Kisumu rehabilitated	% completion	-	1	NMK	SDCH
	Vasco Da Gama Walkways upgraded -	% completion	-	-	NMK	SDCH
	Cultural festivals held.	No. of Cultural festivals held.	2	2	NMK	SDCH
	Art and food ways exhibitions and national handcraft shows held	No. of Art and food ways exhibitions held.	3	5	NMK	SDCH
	NAICEC constructed	% completion	-	100	NMK	SDCH
	Construction of Heritage collection	Centre % completion	-	100	NMK	SDCH
	Integrated Public Records and Information Management System (IPRIMS)	% completion	20	100	NMK	SDCH

Priority Project	Output	Indicator	Targets		Lead Agency	Supporting Agency
			2023/24	2027/28		
National and County archival services and public records Management	Multi-purpose National Archives constructed in Nairobi and County archives established	% of completion	-	100	KNADS	SDCH
	Archive materials Digitized	% of digitized archival materials	20	100	KNADS	SDCH
		% of records digitized in the records management unit	16	-	RMD	SDCH
	Migrated archives retrieved	% of migrated archives to Kenya	20	100	KNADS	SDCH
	Integrated Public Records and Information Management System (IPRIMS) strengthened	No. of Ministries using IPRIMS System	22	100	RMD	SDICT&DE
Accelerated Rangeland development	Rangeland ecosystem infrastructure developed (trees, bamboo, water pans, boreholes and dams)	No. of Infrastructure developed	285	25	SDARD	SDF, CGs
	Rangeland GIS and knowledge Management Centre	Operational Centre	-	-	SDARD	CGs NDMA
	Social and cultural integration of communities	No. of communities integrated	9	10	SDARD	NDMA
Disaster Management Institutions Development	Disaster Risk Management Centers of Excellence and model schools established	% completion	10	100	NDMA	SDARD
	Disaster Risk Management Emergency Operation Centers established	% completion	30	100	NDOC	SDARD
Formalization of Artisanal Mining Operations	ASM Saccos established	No. of Saccos established	100	100	State Department for Mining	(SDM) CGs
	ASM Cooperative Registered	No. of ASM Cooperatives	100	100	SDC	SDM
Mineral Value Addition and processing	Mineral Value Addition Centres	No. of Mineral Value Addition Centres established	2	3	SDM	CGs
Mineral resource Development and Commercialization	Strategic minerals explored and commercialized	Quantity of minerals (MT)	4	2	NMC	CGs
Online Transactional Mining Cadastre System	An online transactional mining cadastre system upgraded	An operational online transactional mining cadastre system	4	3	SDM	SDICT&DE
Formalization of Artisanal fisheries operations	Artisanal fishermen mobilized into cooperatives	No. of Artisanal fishermen	15,000	15,000	SDC	SDF, KFMA; BMUs
Fisheries Management and Conservation	Specific fisheries management plans for marine and inland fisheries developed	No. of Plans	1	2	KeFS	SDBEF, CGs
	Fisheries critical habitats identified, mapped and gazetted	No. of Fisheries critical habitats	10	10	KeFS	SDBEF, CGs
	Created awareness on Eat more fish campaign	Level of awareness created	5	100	SDBEF	SDISNA, CGs

Priority Project	Output	Indicator	Targets		Lead Agency	Supporting Agency
			2023/24	2027/28		
Blue Economy Investment and Development	Developed ultra-modern tuna fish hub at Liwatoni	Level of development ultra-modern tuna fish hub at Liwatoni	50			
	Developed Lamu Fish Processing Plant	% level of completion	-	-	SDBEF	SDPW, SDLPP, SDWS, SDE, SDR, NLC
	Kabonyo Fisheries and Aquaculture Service and Training Centre of Excellence (KFASTCE) developed	% level of completion	5	100	SDBEF	SDPW, SDLPP, SDWS, SDE, SDR, NLC, SDT-VET
	Kenya Marine Fisheries and Socio-Economic Development (KEMFSED) implemented	% completion	50	-	SDBEF	SDPW, TNT, SDLPP, SDWS, SDE,SDR, NLC,CGs
	Rural households engaged in aquaculture farming and provided with fish production materials	No. of rural households;	3,000	-	SDBEF	SDPW, TNT, SDLPP, SDWS, SDA, SDR, NLC, CGs
		No. of farmers	3,000			
Fisheries Resources Development and Utilization	Developed and rehabilitated inland fish landing sites	No. of fish landing sites	-	-	SDBEF	SDPW, SDLPP, SDWS, SDE, SDR, NLC
	Developed Maritime Spatial Plan	% of completion	-	-	SDSMA	SDBEF, SDWS, SDLPP, NLC
	Seaweed drying sheds and storage constructed	No. of drying sheds and storage facilities	-	-	SDBEF	SDPW, SDWS, SDE
	Marine fisheries infrastructure developed/ rehabilitated	No. of marine fisheries infrastructure	2	1	SDBEF	SDLPP, SDWS, SDE, SDR, NLC
	Deep-sea industrial fishing developed	No. of acquired/ reflagged national fishing and merchant vessels / boats	30	70	SDBEF	TNT, SDSMA
	Marine Stock Assessment Surveys conducted	No. Assessment Surveys	1	1	KMFRI	SDBEF, SDISNA
	Youth capacity built on fisheries and aquaculture skills	No. of youth	500	1,000	SDBEF	SDYA
	Support Common Interest Groups (CIG) members	No. of CIGs supported	1,600	-	SDBEF	SDBEF
	Kalokol fish processing plant constructed	% of completion	20	-	SDARD	SDARD
Kenya National Shipping Line	Vessels acquired	No. of vessels acquired	-	-	SDSMA	SDSM
	Shipping vessels chartered	No. of vessels chartered	4	-	SDSMA	SDSM
	Container equipment acquired	No. of container equipment acquired	-	-	SDSMA	SDSM

Priority Project	Output	Indicator	Targets		Lead Agency	Supporting Agency
			2023/24	2027/28		
Integrated Fish Resource Development	Acres of mangrove cover restored	Acres of mangrove cover	500	500	SDSMA	SDFBE
	Acres coral reef conserved	Acres of coral reef	30	30		
	Fish farms and processing plants established	No. of fish farms and processing plants	-	-	SDARD	COG, CGs
Lake Victoria Basin Cold Storage Facilities Development	Cold storage facilities with a capacity of 600m3 constructed	No. of cold storage facilities constructed	-	1	SDARD	TNT, SDBEF
