# **Forest statistics in the FDES**

Topics 1.2.3: Forests, 2.3.2: Use of forest land, 2.5.1: Timber resources, and 2.5.5: Other non-cultivated biological resources of the Basic Set of Environment Statistics of the FDES 2013

National Workshop on Environment Statistics and Climate Change Statistics

St. George's, Grenada, 12-14 November 2019

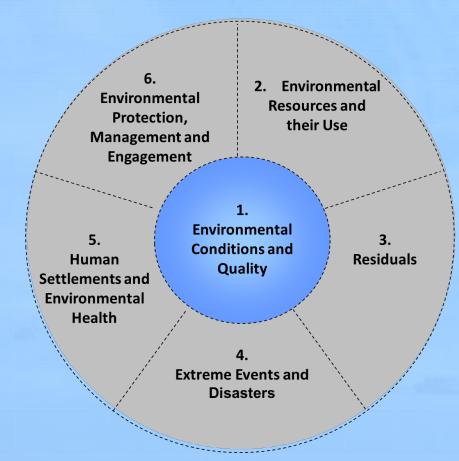

Environment Statistics Section, United Nations Statistics Division

## **Forest statistics (4 Topic)**

- 1. Learning objectives
- 2. Review of Level 0
- 3. Level 1 (Compilers)
  - Key statistical concepts
  - Group exercise & Discussion
- 4. Level 2 (Data providers)
  - Data options, examples & issues
  - Group exercise & Discussion
- 5. Closing Discussion

## 'We can't live without forests'

Eight thousand years ago, half of the Earth's land surface was covered by forests or wooded areas. Today, these areas represent less than one third. Forests are home to 80% of the world's land-based biodiversity and billions of dollars worth of medicinal plants are harvested from tropical forests every year. In addition, **1.6 billion people** depend on them to some extent for their livelihoods.

FAO (http://www.fao.org/zhc/detail-events/en/c/262862/)

eve

'Forest is land spanning more than 0.5 hectares with trees higher than 5 meters and a canopy cover of more than 10 percent, or trees able to reach these thresholds in situ.
It does not include land that is predominantly under agricultural or urban land use' *FAO (2018) Global Forest Resources Assessment 2020: Terms and Definitions (FRA 2020) (http://www.fao.org/3/l8661EN/i8661en.pdf)*

evel

Key global statistics on forests (from latest IPBES report):

- 45%: increase in raw timber production since 1970 (4 billion cubic meters in 2017)
- 50%: agricultural expansion that occurred at the expense of forests
- 50%: decrease in net rate of forest loss since the 1990s (excluding those managed for timber or agricultural extraction)
- 68%: global forest area today compared with the estimated pre-industrial level
- 7%: reduction of intact forests (>500 sq. km with no human pressure) from 2000-2013 in developed and developing countries
- 290 million ha (+/-6%): native forest cover lost from 1990-2015 due to clearing and wood harvesting
- 110 million ha: rise in the area of planted forests from 1990-2015
- 10-15%: global timber supplies provided by illegal forestry (up to 50% in some areas)
- >2 billion: people who rely on wood fuel to meet their primary energy needs

Level 0

- Policy context: global climate regulation, climate change mitigation, multiple ecosystem services, biodiversity, REDD+
- Uses: evidence to support policies, from local to global
- Needs: globally, the extent of the world's forests continues to decline as human populations continue to grow and demand for food and land increases
- Gaps: despite great advance in mapping/inventory technology, uncertainties and data gaps remain: e.g. on biomass, forest composition

# SDGs on Forests

**Indicator 2.3.1:** Volume of production per labour unit by classes of farming/pastoral/forestry enterprise size

Level 0

6 CLEAN WATER AND SANITATION

**Indicator 6.6.1:** Change in the extent of water-related ecosystems over time

15	LIFE On land

- Indicator 15.1.1: Forest area as a proportion of total land area
- Indicator 15.2.1: Progress towards sustainable forest management
- Indicator 15.b.1: Official development assistance and public expenditure on conservation and sustainable use of biodiversity and ecosystems

# How do forest statistics look like?

Level 0

## Basic table template

#### Topic 1.2.3: Forests

a.	Forest area (also in 1.2.1.a and 1.2.2.a)		2005	2010	2015
	1	Total	Area	Area	Area
	2	Natural	Area	Area	Area
	3	Planted	Area	Area	Area
	4	Protected forest area (also in 1.2.3.c)	Area	Area	Area
	5	Forest area affected by fire	Area	Area	Area
b.	Forest biomass				
	1	Total	Volume	Volume	Volume
	2	Carbon storage in living forest biomass	Mass	Mass	Mass

# What do you need to compile forest statistics?

Level 0

- 1. NSDI, GIS platform
- 2. Expertise (EO, forests inventories)
- 3. Forest inventories data (from network of plots)
- 4. Classification(s) and units
- 5. Compilation templates

# Welcome to Level 1: Forest statistics

# Level 1: learning objectives

eve

## Get familiar with:

- Key concepts on producing basic forest statistics
- Key definitions and classifications (from MS)
- Data needs and sources (Department of Forestry)
- Aggregation and disaggregation
- Data quality and validating statistics

## Input data on forest

# 1. GIS platform: ArcGIS, qGIS, R, Python

2. EO instruments: ESA Sentinels, NASA MODIS, Landsat

3. Maps

Forest cover, forest composition, at least 2 points in time

Level

Forest use and ownership

Admin. units, boundaries

Other helpful spatial data: deforestation, protected areas, infrastructure

4. Ground data and statistics: forest plots

## Definitions

- Total (forest area) (FDES 1.2.3.a.1): The total area of forest
- Natural (forest area) (FDES 1.2.3.a.2): Forest predominantly composed of trees established through natural regeneration
- Planted (forest area) (FDES 1.2.3.a.3): The area of forest predominantly composed of trees established through planting and/or deliberate seeding
- Total (forest biomass) (FDES 1.2.3.b.1): .. composed of above-ground, belowground and dead wood biomass = Carbon storage
- Area deforested (FDES 2.3.2.a.1): conversion of forest to other land use
- Area reforested (FDES 2.3.2.a.2): Area of re-establishment of forest through planting and/or deliberate seeding on land classified as forest
- Area afforested (FDES 2.3.2.a.3): Area of establishment of forest through planting and/or deliberate seeding on land that, until then, was under a different land use, implies a transformation of land use from non-forest to forest

# Definitions

- Stocks of timber resources (FDES 2.5.1.a.1): The stock of timber resources is defined by the volume of trees, living or dead, and include all trees regardless of diameter, tops of stems, large branches and dead trees lying on the ground that can still be used for timber or fuel
- Forest production (FDES 2.5.1.c) and Fuelwood production (FDES 2.5.1.d): Wood forestry products cover removals of roundwood (including wood fuel and industrial roundwood) and production of wood products (e.g., sawnwood, wood pulp, veneer sheets etc.).
- Imports of forest products (FDES 2.5.1.e)
- Exports of forest products (FDES 2.5.1.f)
- Non-wood forest products and other plants (FDES 2.5.5.f): Goods derived from forests that are tangible and physical objects of biological origin other than wood

## Classifications

## \_eve

### Forest products (FAO/UNECE)

Group 1: Wood in the rough

Group 2: Residues of wood processing; recoverable wood products

Group 3: Wood chips and particles

Group 4: Wood simply worked or processed

Group 5: Wood sawn lengthwise: veneer sheets

Group 6: Wood-based panels (including similar par Table 11.1. Relative extents of different types of Indian forest.

Group 7: Pulp of wood or other ligna-cellulosic ma

Group 8: Paper and paperboard

Group 9: Waste paper

Group 10: Raw, semi-processed and worked cork

- Forest composition:
- Example India

(Champion and Seth (1968)

Forest type	Area (in million hectare)	Percent of total forest area
Tropical moist evergreen	4.5	5.8
Tropical moist semievergreen	1.9	2.5
Tropical moist deciduous	23.3	30.3
Littoral and Swamp	0.7	0.9
Tropical dry evergreen	0.1	0.1
Tropical dry deciduous	29.4	38.2
Tropical Thorn	05.2	6.7
Subtropical broad leaved montane wet forest	0.3	0.4
Subtropical dry evergreen	0.2	0.2
Subtropical pine	3.7	5.0
Montane wet temperate	1.6	2.6
Himalayan moist temperate	2.6	3.4
Himalayan dry temperate	0.2	0.2
Subalpine	3.3	4.3
Moist alpine	-	_
Dry alpine		_

Environment Statistics Section, United Nations Statistics Division

## From data to statistics

 Forest statistics are usually well developed, by respective National agencies/departments

Level

- Additional data processing may be needed to produce forest statistics/accounts using multiple inputs (from different departments)
  - Review and harmonizing definitions and classifications on forest
  - Spatial data corrections and harmonization of input data (common projections, extents, spatial resolution)
  - Conversions for biomass

## Forest inventory data

		(Tre	N es ha <sup>-1</sup> )		<b>D</b> (m)			H (m)			Basal area (m² ha <sup>-1</sup> )

Mund, M. (2004). Carbon pools of European beech forests (Fagus sylvatica) under different silvicultural management, Citeseer.

Level 1

## Aggregation and disaggregation

- Units: parcels (properties); natural communities
- Spatial aspects: forest cover in spatially explicit way, products - national
- Temporal aspects: FRA every 5 years

# Welcome to Level 2: Forest statistics

•1

## Level 2

# Level 2: Learning objectives

1. More conceptual issues:

- Role of statistics in rapidly growing environmental challenges linked to forests: e.g. ecosystem services versus development policies
- Integration, impartiality and quality standards
- one official set of statistics, for multiple uses
- 2. Examples from other countries
- 3. Input data options and sources
  - International data
  - Multiple sources, new methods
  - Metadata
- 4. Data quality and uncertainty

## How do forest statistics look like?

### Examples from compendia: India

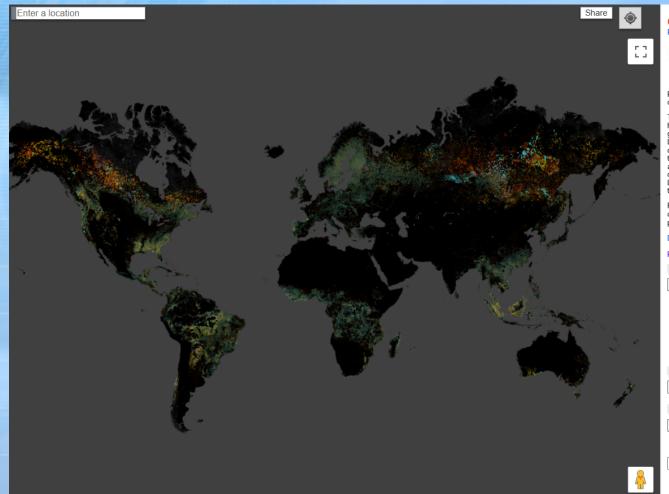

#### Statement 1.47 : Forest cover in India - classwise

Class	2005		2011		2013		20	)15	2017	
	Area ( Sq. Km )	Percentage of Geographic Area	( Sq. Km )	Percentage of Geographic Area	( Sq. Km )	Percentage of Geographic Area	Area (Sq. Km)	Percentage of Geographic Area	Area (Sq. Km)	Percentage of Geographic Area
Forest Cover	Forest Cover									
Very Dense Forest	54,569	1.66	83,471	2.54	83,502	2.54	85,904	2.61	98,158	2.99
Moderately Dense Forest	332,647	10.12	320,736	9.76	318,745	9.7	315,374	9.59	308,318	9.38
Open Forest	289,872	8.82	287,820	8.75	295,651	8.99	300,395	9.14	301,797	9.18
Total Forest Cover*	677,088	20.6	692,027	21.05	697,898	21.23	701,673	21.34	708,273	21.54
Scrub	38,475	1.17	42,176	1.28	41,383	1.26	41,362	1.26	45,979	1.4
Non-forest	2,571,700	78.23	2,553,060	77.67	2,547,982	77.51	2,544,228	77.4	2,533,217	77.06
Total Geographic Area	3,287,263	100	3,287,263	100	3,287,263	100	3,287,263	100	3,287,469	100

## High-resolution global maps of 21st-century forest cover change

Source: Hansen, M. C., et al. (2013). "High-resolution global maps of 21stcentury forest cover change." Science 342(6160): 850-853.

#### Global Forest Change Published by Hansen, Potapov, Moore, Hancher et al. NIVERSITY OF

Results from time-series analysis of Landsat images characterizing forest extent and change

Trees are defined as vegetation taller than 5m in height and are expressed as a percentage per output grid cell as '2000 Percent Tree Cover', 'Forest Cover Loss' is defined as a stand-replacement disturbance. or a change from a forest to non-forest state, during the period 2000-2018. 'Forest Cover Gain' is defined as the inverse of loss, or a non-forest to forest change entirely within the period 2000-2012. 'Forest Loss Year' is a disaggregation of total 'Forest Loss' to annual time scales

Reference 2000 and 2018 imagery are median observations from a set of quality assessmentpassed growing season observations.
