

Spatial referencing

An overview

Richard Knippers

UNIVERSITY OF TWENTE.

FACULTY OF GEO-INFORMATION SCIENCE AND EARTH OBSERVATION

Learning instructions

Learning activities:

- Literature: ITC Core textbook, Chapter 3.1 on Spatial Referencing.
- Website: <http://kartoweb.itc.nl/geometrics>
- Exercise: Spatial referencing (ArcMap10)

Questions: Blackboard Discussion Board

Main objectives

- Understand the relevance and actual use of reference surfaces, coordinate systems, and coordinate transformations in mapping.
- Describe and differentiate between coordinate systems and map projections.
- Grasp the logic of map projection equations and the principles of transforming maps from one projection system to another.

Contents

- Spatial reference surfaces and datums
 - The Geoid - vertical (height) datum
 - The Ellipsoid - horizontal (geodetic) datum
 - Local and global datums
- Map projections
 - Classification of map projections
 - Map projection selection
 - Map coordinate systems (e.g. UTM)
- Coordinate transformations

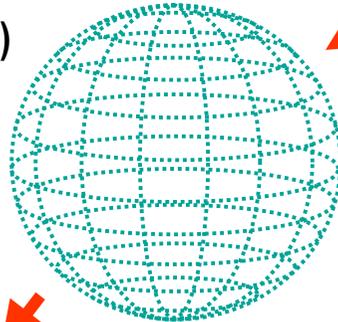

Earth to Map

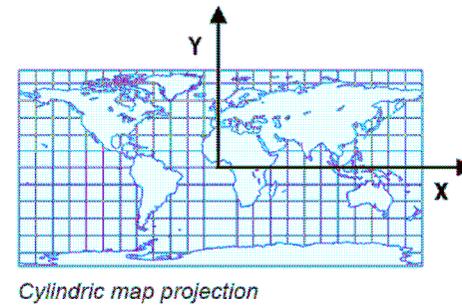

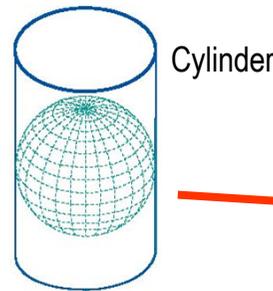

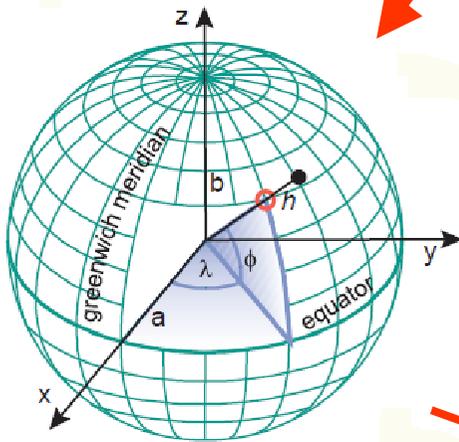

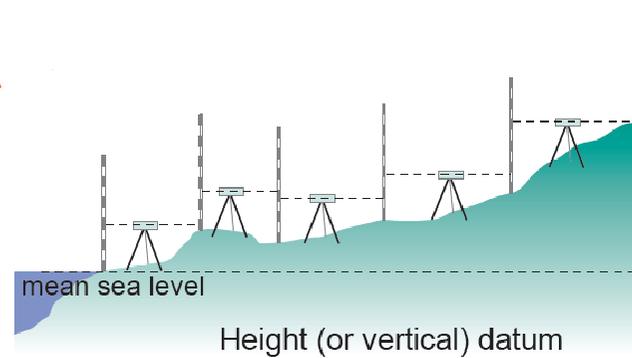

The Earth: a complex shape

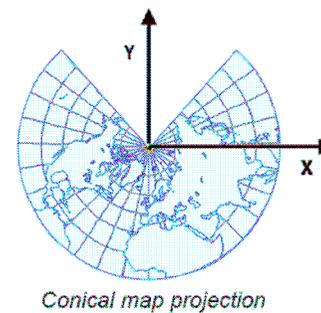

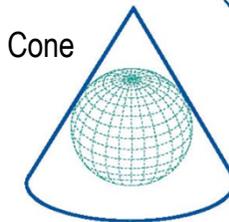

Ellipsoid (best fitting)

Independent handling of horizontal and vertical

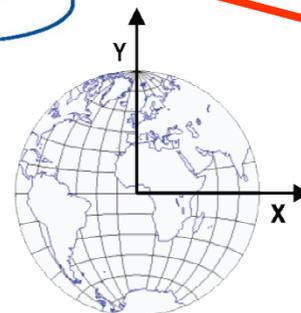

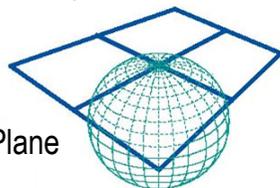

Cylindric map projection

Conical map projection

Geodetic (or horizontal) datum

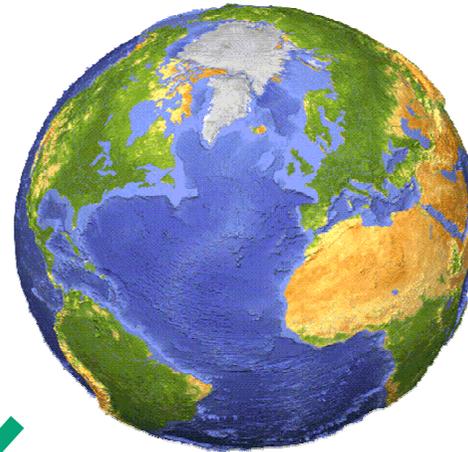

Azimuthal map projection

Plane

Mapping surface

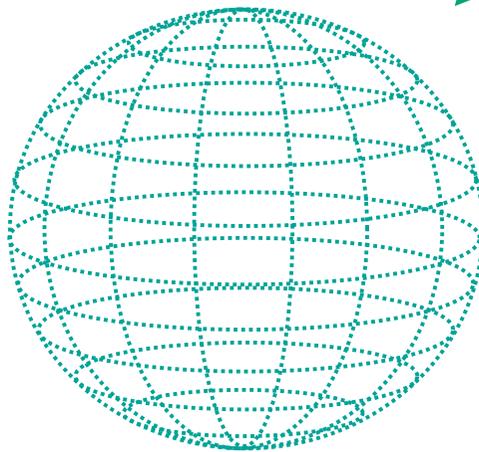

Reference surfaces for mapping

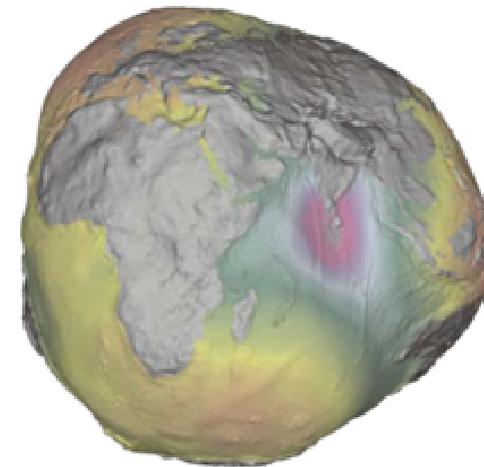

The Earth

Independent handling of

The Geoid - Vertical (height) datum

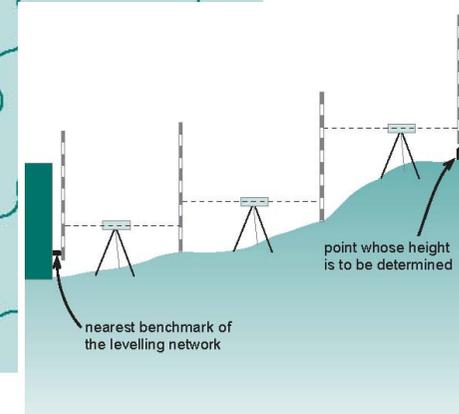

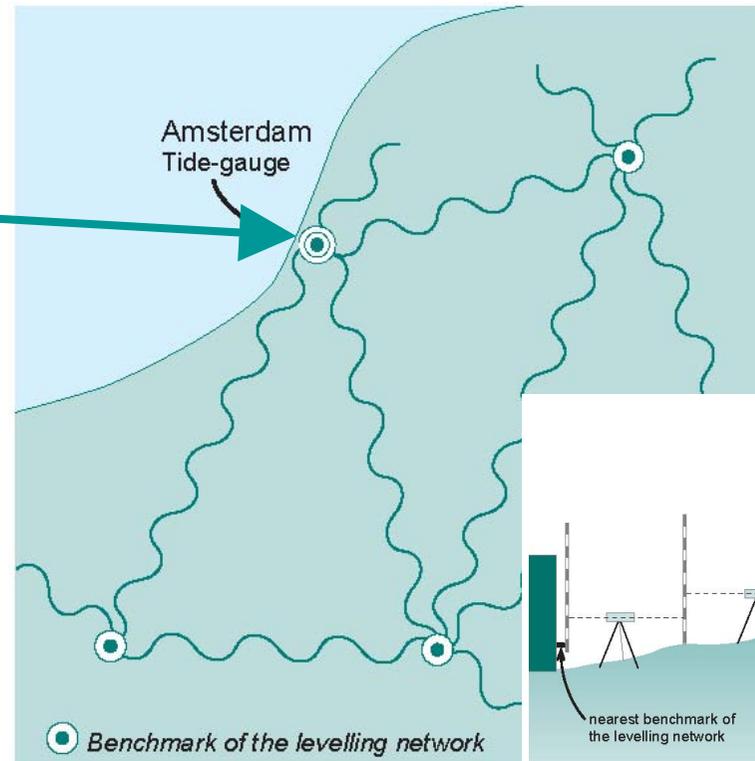

The Earth

The Geoid

Global Sea Level

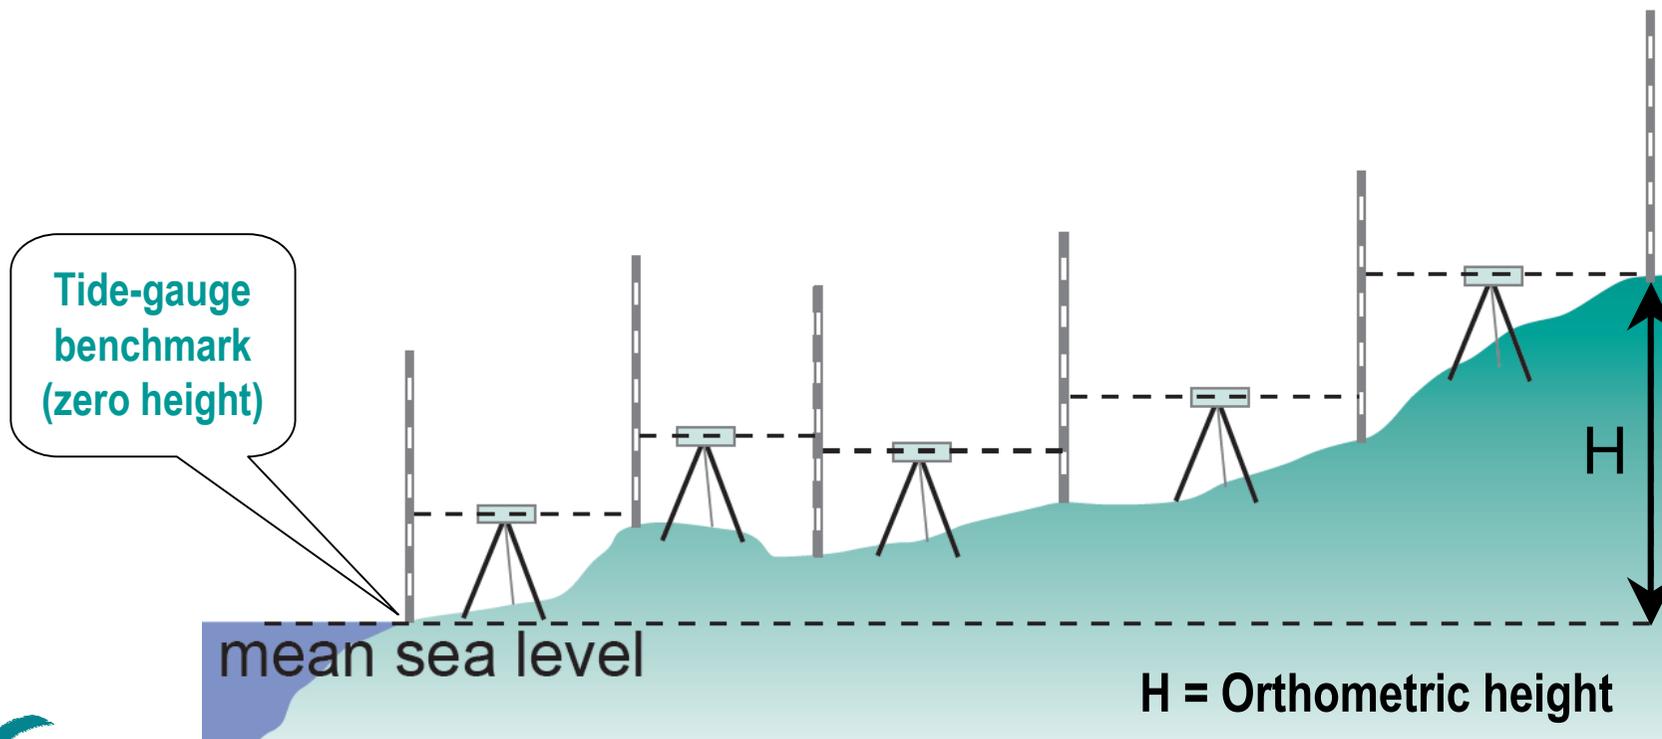

UNIVERSITY OF TWENTE.

Geodetic levelling

Starting from Mean Sea Level (MSL) points, the heights (H) of points on the Earth can be measured using a technique known as geodetic leveling.

Vertical datums

Every country (or group of countries) has its own Mean Sea Level - its own vertical (height) datum.

At what height do we live?

HOE HOOG woont U?

Uw postcode:*

*cijfers en letters aan elkaar

Nauwkeurigheid:

Door het intikken van uw postcode kunt u een indicatie krijgen van de maaiveldhoogte van uw eigen omgeving. Deze hoogtemeter zoekt naar de dichtstbijzijnde hoogtemeting **binnen een straal van 600 meter** van uw postcode.

De waarden zijn afgerond op decimeters en t.o.v. het Normaal Amsterdams Peil (NAP). De hoogten zijn afkomstig van het Actueel Hoogtebestand Nederland, voor zover dit gereed is, en het TOPhoogteMD (oudere hoogtemetingen aangevuld met NAP-punten). Afwijkingen groter dan 1 meter kunnen voorkomen (bijvoorbeeld bij nieuwbouwwijken). Aan de vermelde hoogten kunnen geen rechten worden ontleend.

Voor de postcode: 7514AE
is de gemiddelde hoogte: +37.0 m. N.A.P.

HOE HOOG woont U?

Elevation data are related to Amsterdam Zero (N.A.P.)

GPS height versus N.A.P. height

GPS Reference Stations

Enschede

Station ID
0550

Position and Height

52 13'25" N

6 53'10" E

107,51 m → $h_{WGS84} = 107.5m$

Location

This station is located on the roof of the International Institute for Geo-Information Science and Earth Observation (ITC) in the centre of Enschede.

This station is sending RTCM 18/19 RTK data and storing static data 24 hours a day. This stations is also a part of the GlobalNET and receives the GLONASS signal.

$$H_{NAP} = h_{WGS84} - 44m (N) - 27m (ITC building) = 37m$$

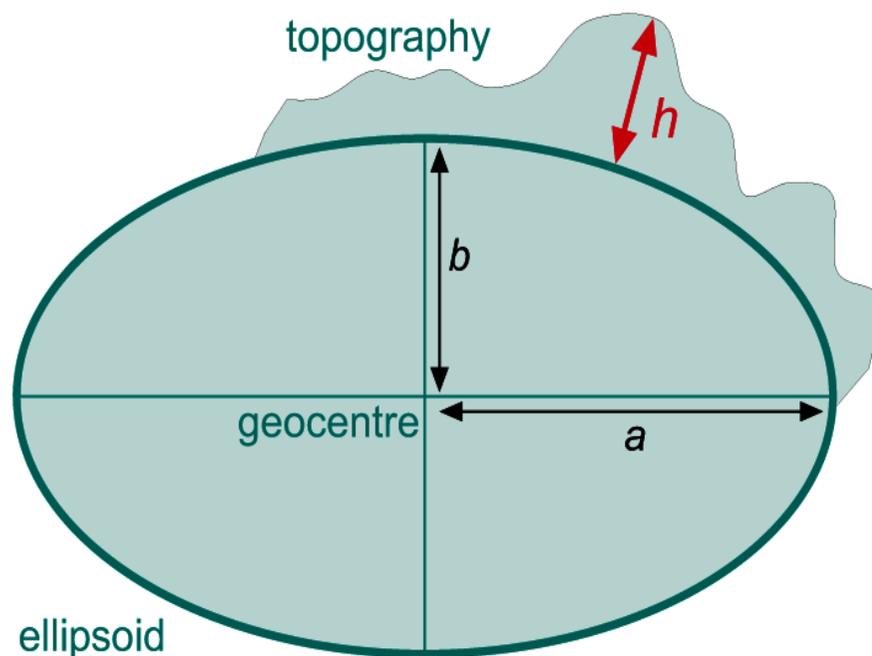

GPS Reference Stations

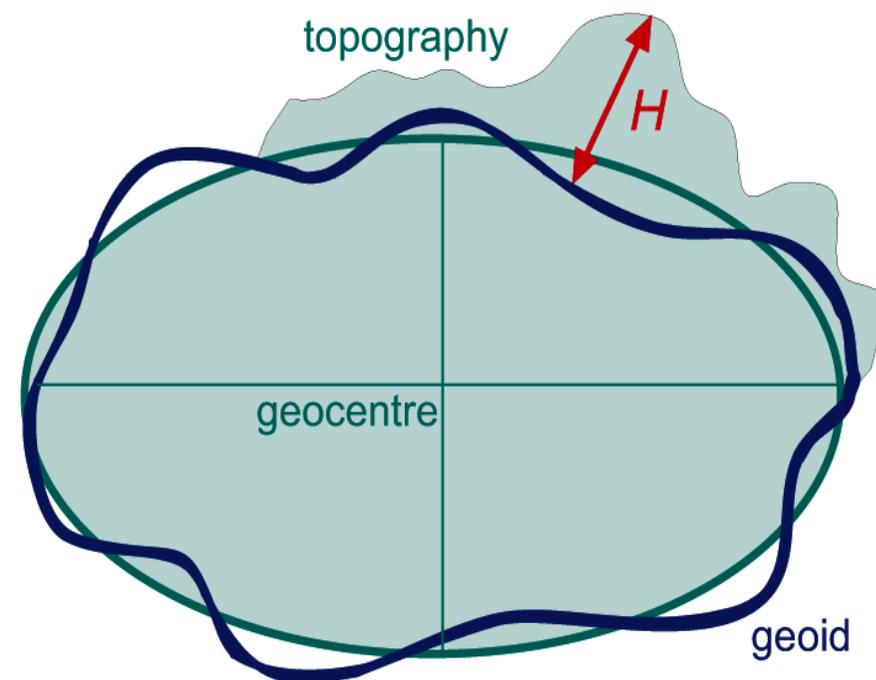

Ellipsoidal height versus Orthometric height

Ellipsoidal height

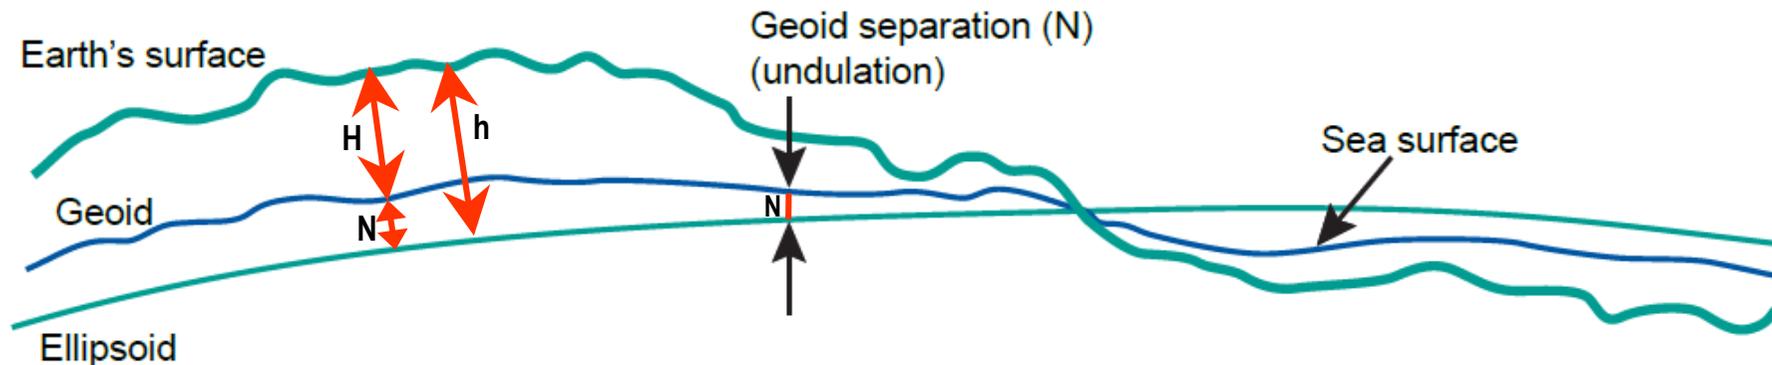

Orthometric height (height above the Geoid)

Relation between Geoid and Ellipsoid

The earth's surface, and the geoid and a reference ellipsoid used to approximate it. The geoidal undulation (N) is the separation between the geoid and an ellipsoid. It varies globally between ± 110 m.

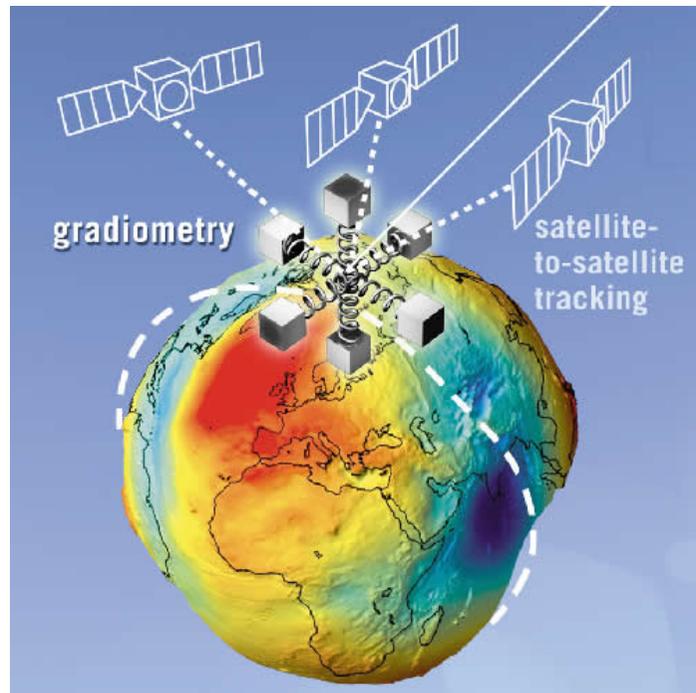

H = Orthometric height
h = Ellipsoidal height
N = Geoidal separation (undulation)

Trends in mapping: global vertical datums

Satellite gravity missions (e.g. GOCE) make it possible to determine a global vertical datum with centimetres accuracy.

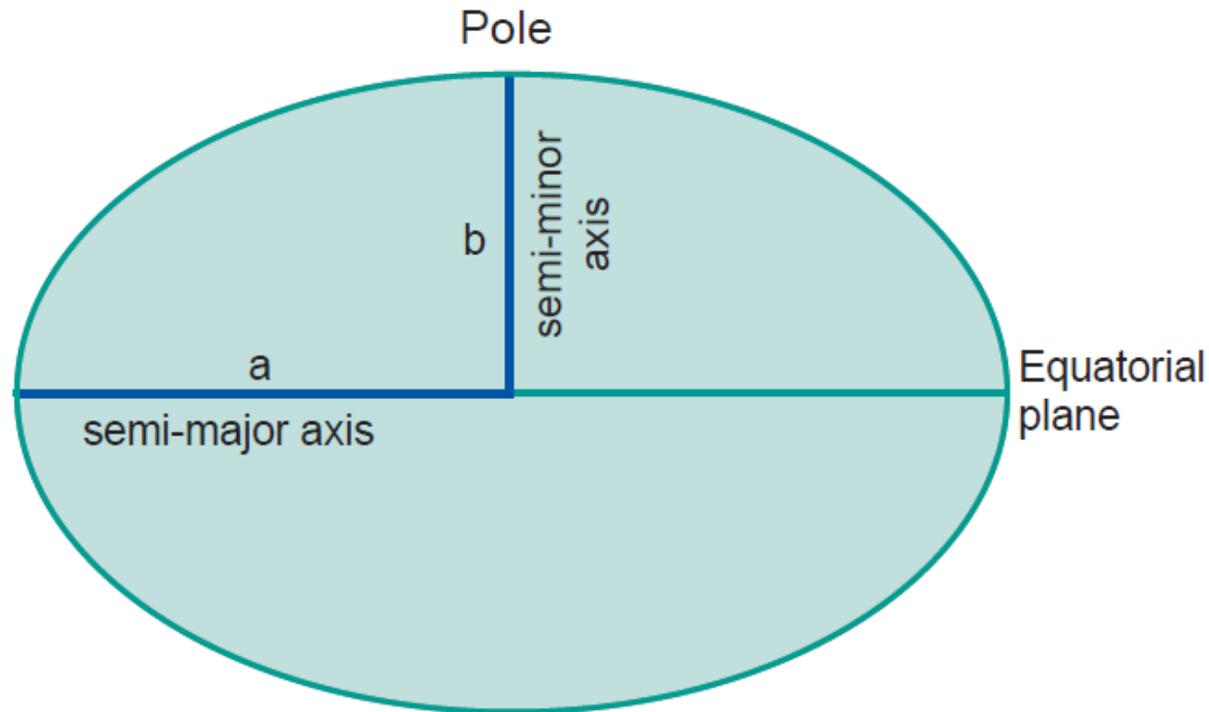

Spatial reference surface - The Ellipsoid

UNIVERSITY OF TWENTE.

FACULTY OF GEO-INFORMATION SCIENCE AND EARTH OBSERVATION

The Ellipsoid

Typical values of the parameters for an ellipsoid:

$$a = 6378137.0 \text{ m}$$

$$f = 1/298.26$$

$$b = 6356752.31 \text{ m}$$

$$e = 0.0818187$$

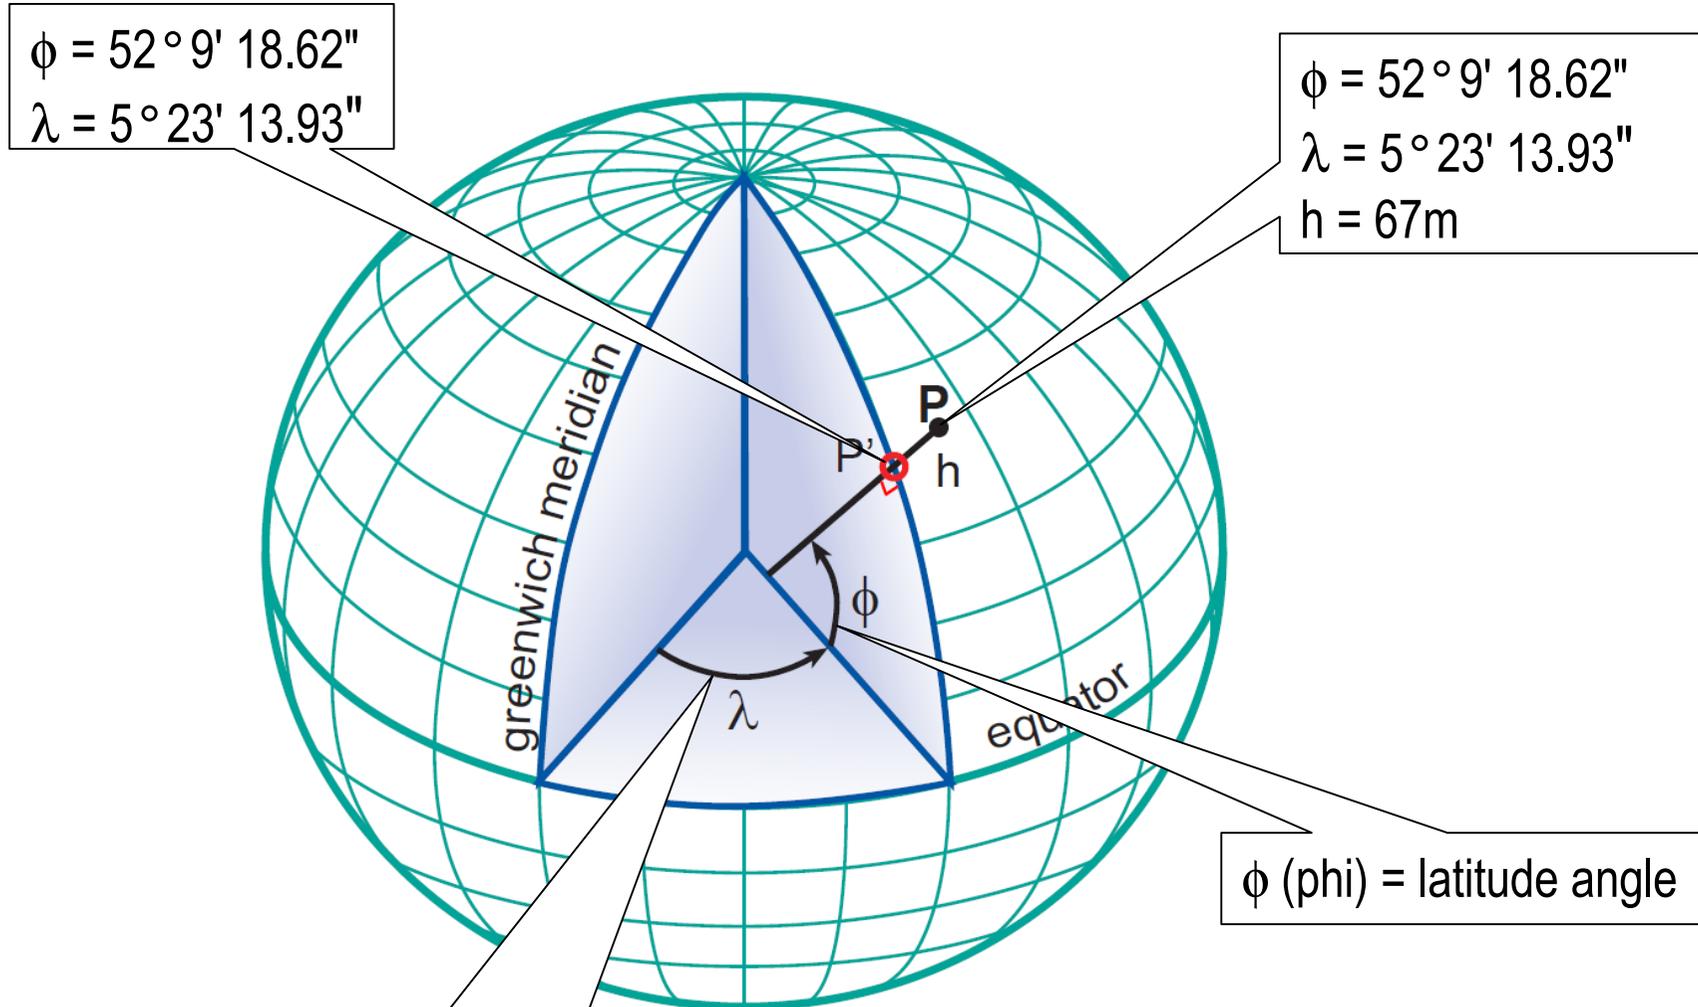

Flattening:

$$f = (a-b)/a$$

Eccentricity:

$$e^2 = (a^2 - b^2)/a^2$$

Geographic coordinates (φ , λ)

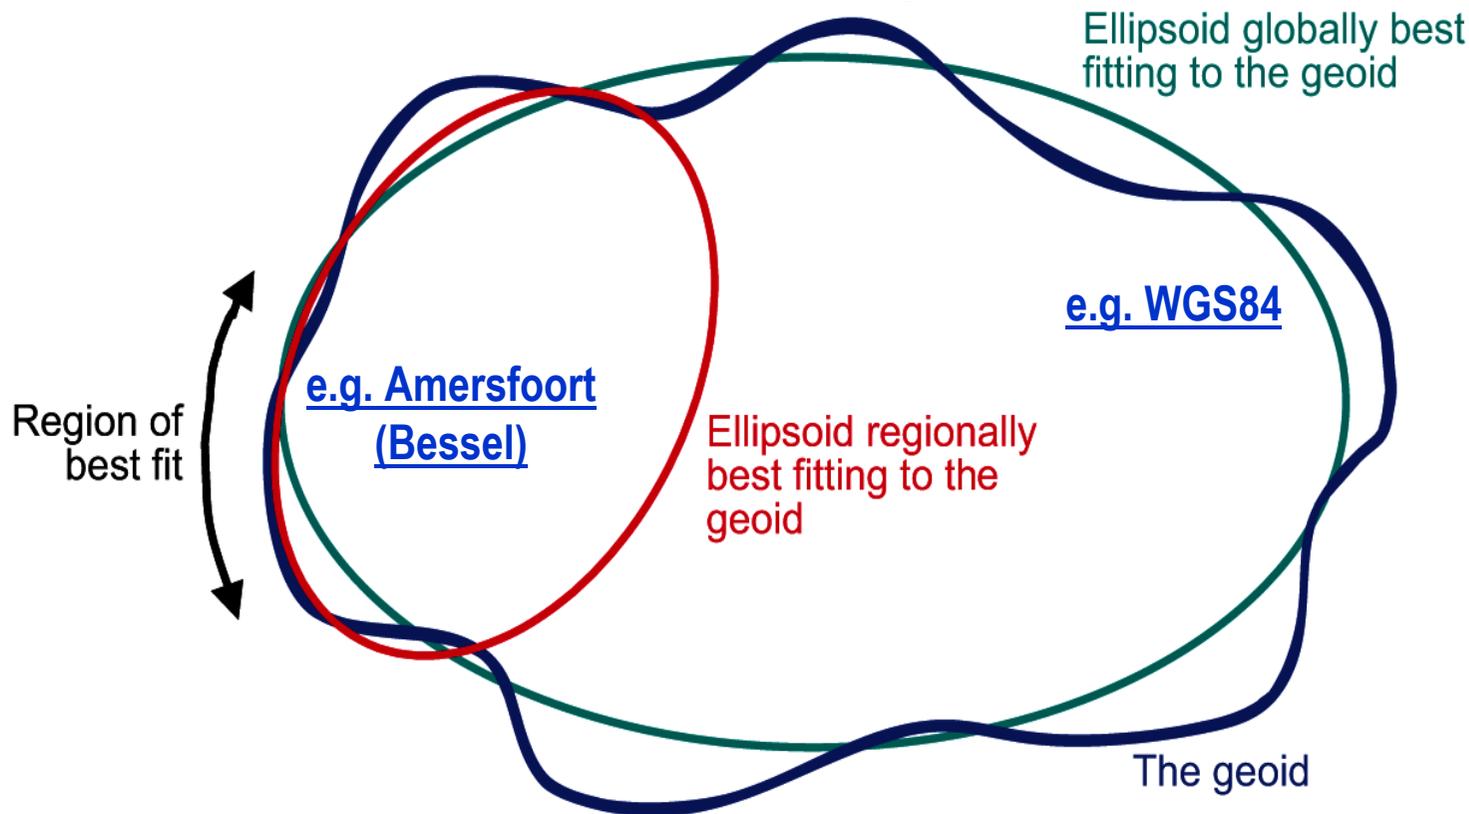

λ (lambda) = longitude angle

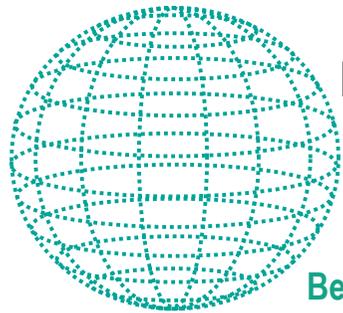

Local and global ellipsoids/datums

The ellipsoid is chosen in such way that it best fits the surface of the area of interest (the country)

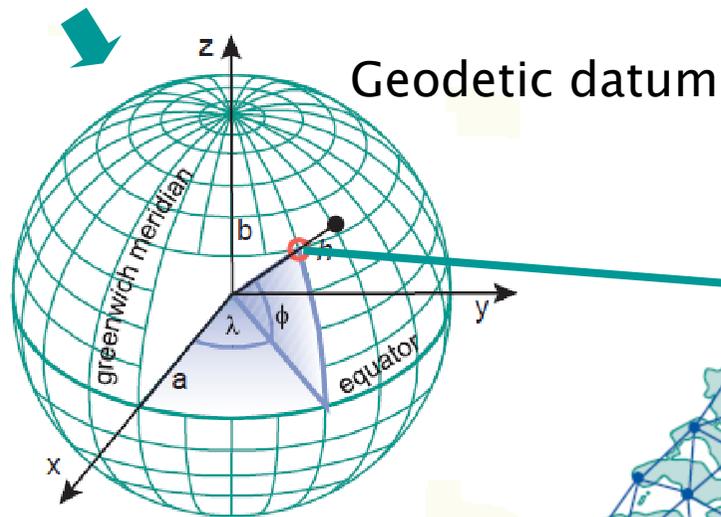

Local datum system of the Netherlands

Ellipsoid

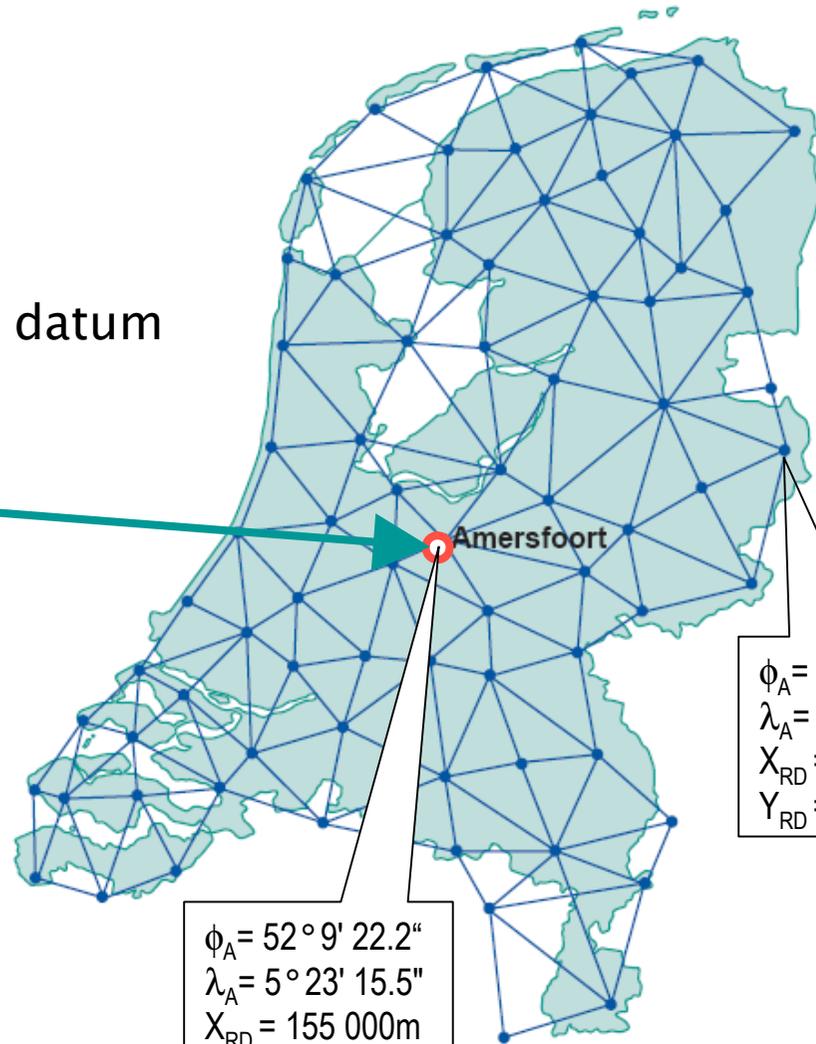

Bessel ellipsoid

Geodetic datum

Amersfoort datum

National triangulation network

$\phi_A = 52^\circ 13' 26.2''N$
 $\lambda_A = 06^\circ 53' 32.1''E$
 $X_{RD} = 257776.47m$
 $Y_{RD} = 471588.14m$

$\phi_A = 52^\circ 9' 22.2''$
 $\lambda_A = 5^\circ 23' 15.5''$
 $X_{RD} = 155\ 000m$
 $Y_{RD} = 463\ 000m$

Local datum systems

Datum	Ellipsoid	Datum shift (m)*		
		(Dx,	Dy,	Dz)
Alaska (NAD-27)	Clarke 1866	-5	135	172
Bahamas (NAD-27)	Clarke 1866	-4	154	178
Bermuda 1957	Clarke 1866	-73	213	296
Central America (NAD-27)	Clarke 1866	0	125	194
Bellevue (IGN)	Hayford	-127	-769	472
Campolnchauspe	Hayford	-148	136	90
Hong Kong 1963	Hayford	-156	-271	-189
Iran	Hayford	-117	-132	-164

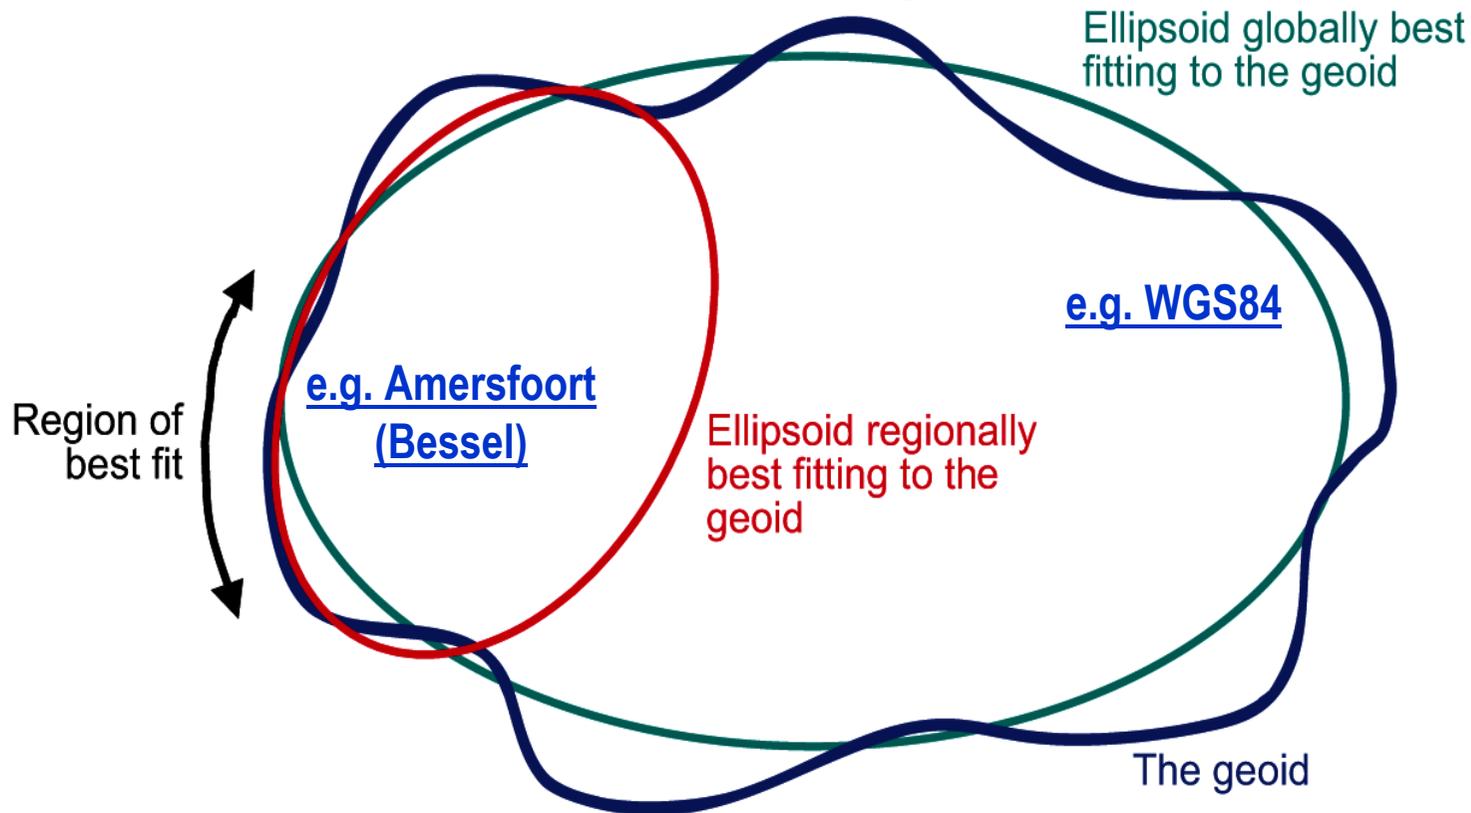

* positions compared to WGS84

Countries (or regions) use there own datum system to make accurate maps.

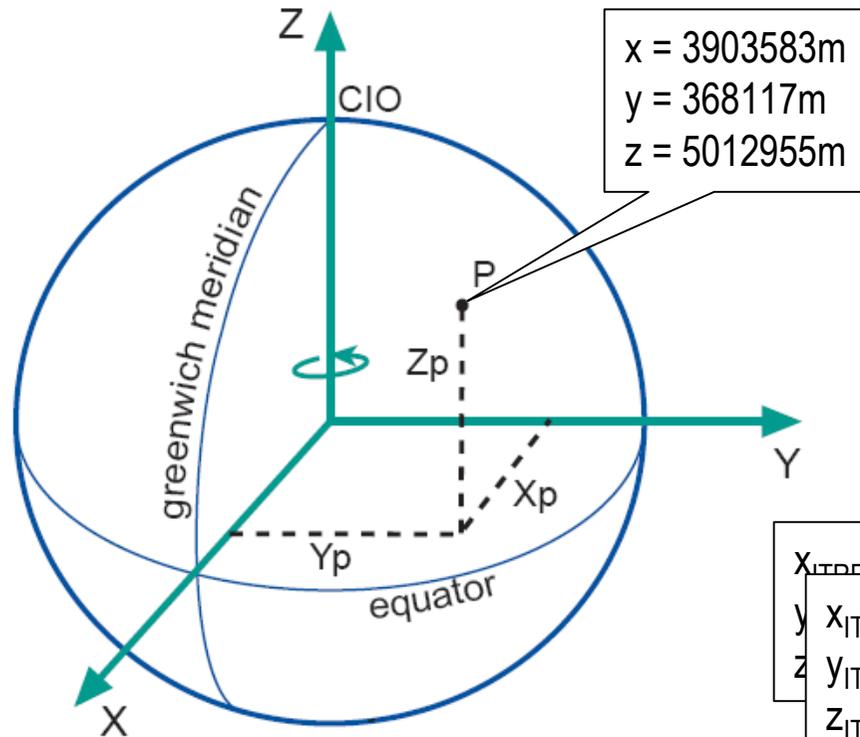

Local and global ellipsoids/datums

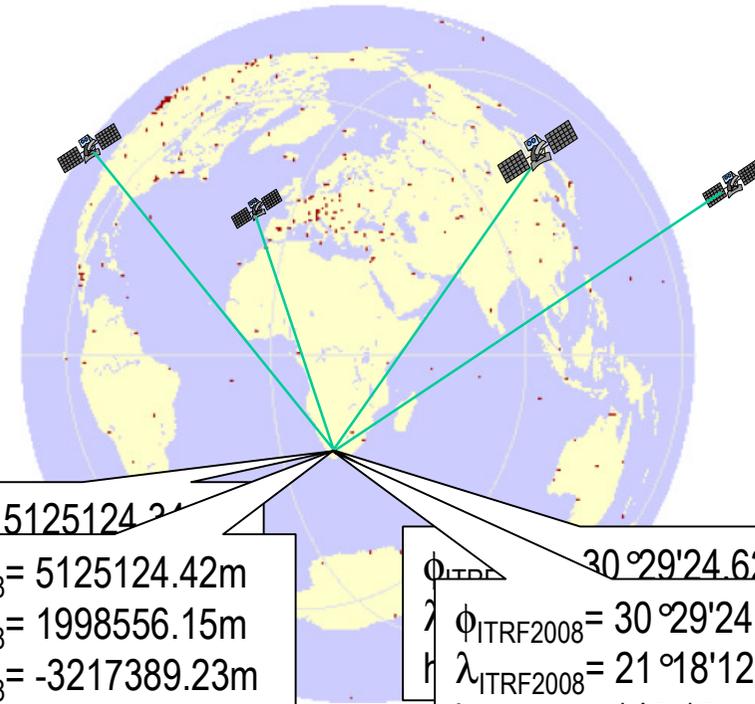

The ellipsoid is chosen in such way that it best fits the surface of the area of interest (the country)

International Terrestrial Reference System (ITRS)

International Terrestrial Reference System (ITRS)

International Terrestrial Reference Frame (ITRF)

Global reference system for global surveying and mapping.
 The system uses the GRS80 (or WGS84) ellipsoid

Trends in mapping: global horizontal datums

Global ellipsoids and datums

to approximate the earth-as-a-whole - with the aid of satellites- are becoming more in use (e.g. WGS84, ITRF, ETRS89).

Changing or re-adjustment of **local ellipsoids and datums** is taking place in many countries.

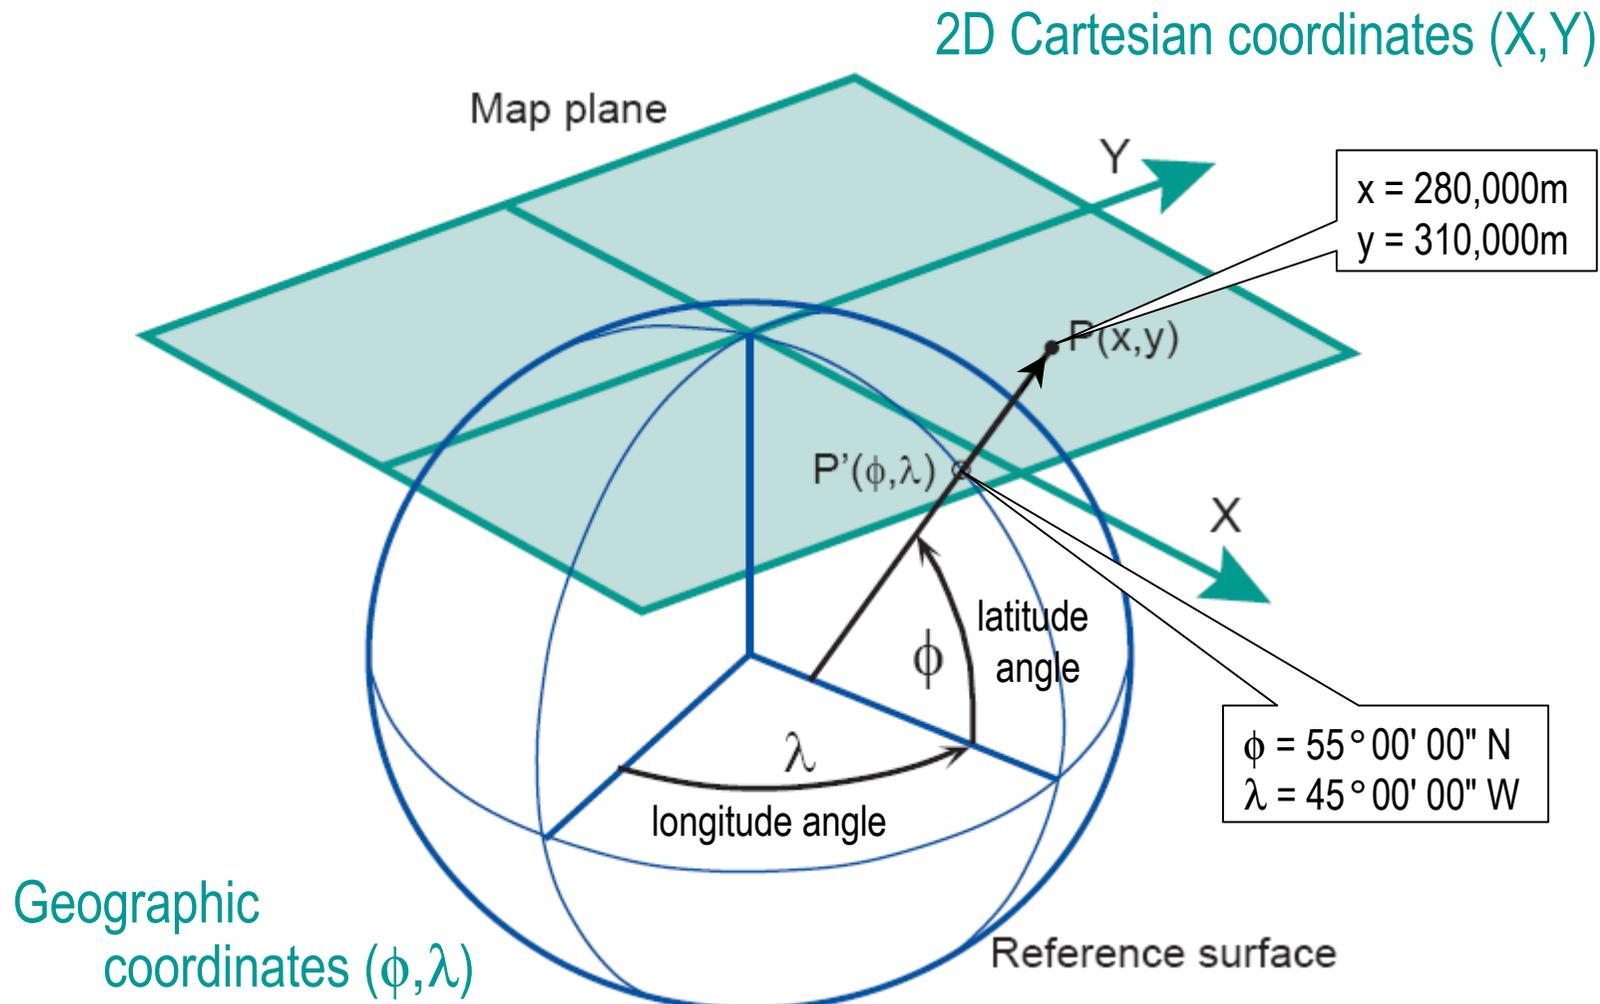

Map projections

UNIVERSITY OF TWENTE.

FACULTY OF GEO-INFORMATION SCIENCE AND EARTH OBSERVATION

Map projection principle

Map projection equations

A map projection is a mathematical function by which **2D Geographic coordinates** (ϕ, λ) are transformed into **2D Cartesian map coordinates** (x, y)

$$(x, y) = f(\phi, \lambda). \quad \textit{Forward equation}$$

$$(\phi, \lambda) = f^{-1}(x, y). \quad \textit{Inverse equation}$$

Map projection equations (example)

Map projection equations for the Mercator projection (spherical assumption)

Forward mapping equation:

$$x = R(\lambda - \lambda_0)$$

$$y = R(\ln(\tan(\frac{\pi}{4} + \frac{\phi}{2})))$$

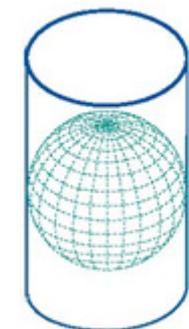

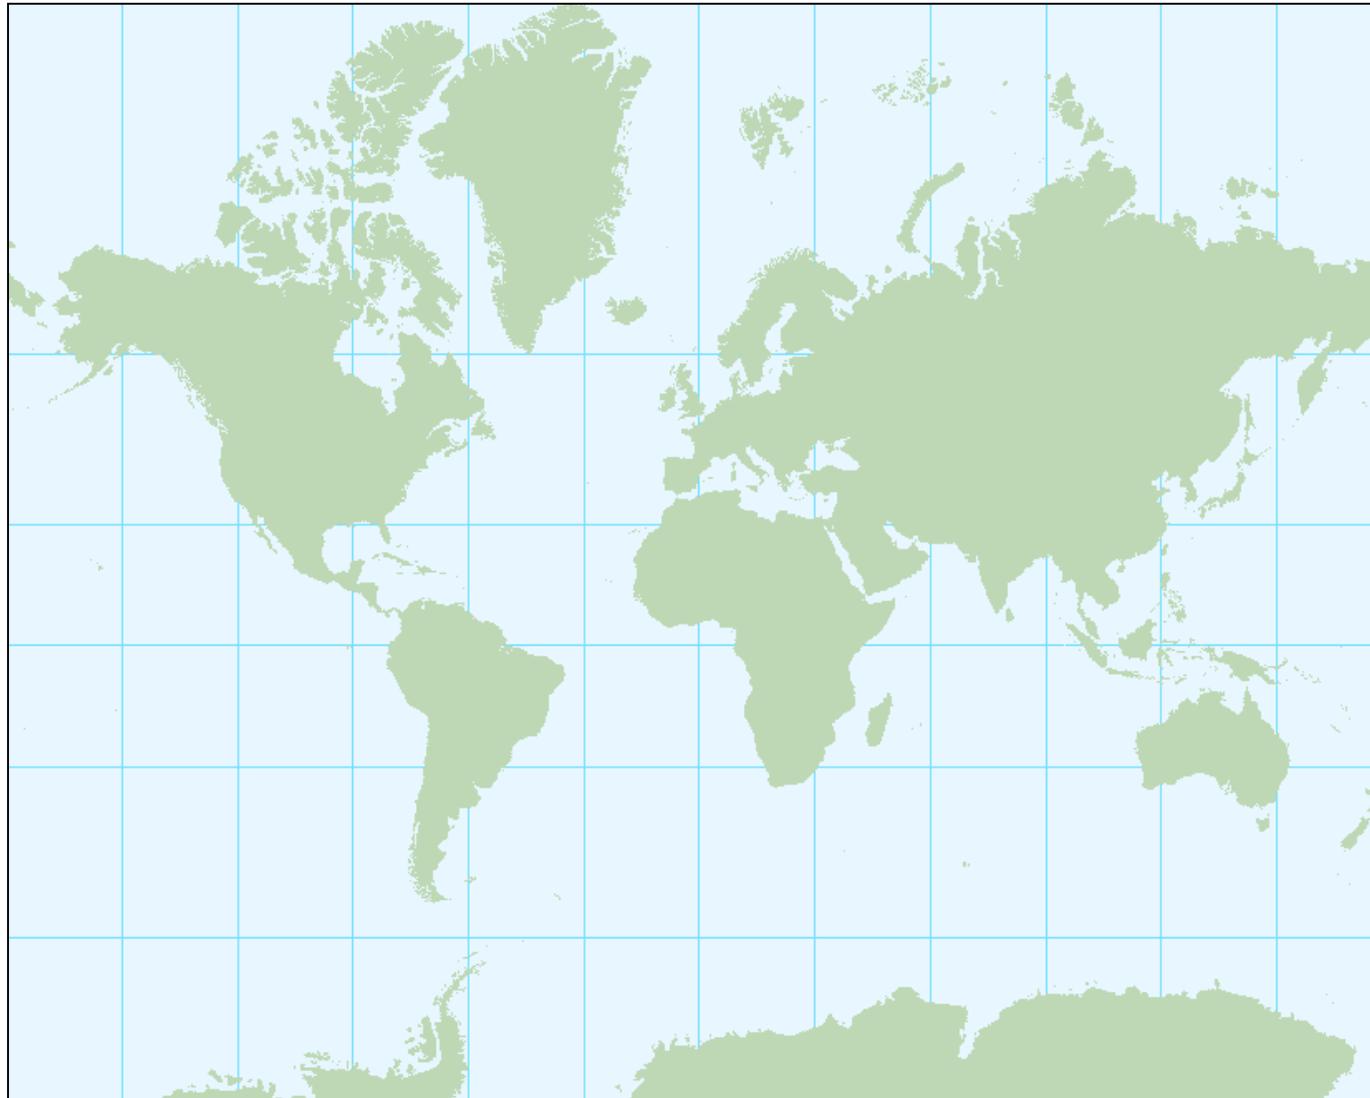

Inverse mapping equation:

$$\phi = \frac{\pi}{2} - 2 \arctan(e^{\frac{-y}{R}})$$

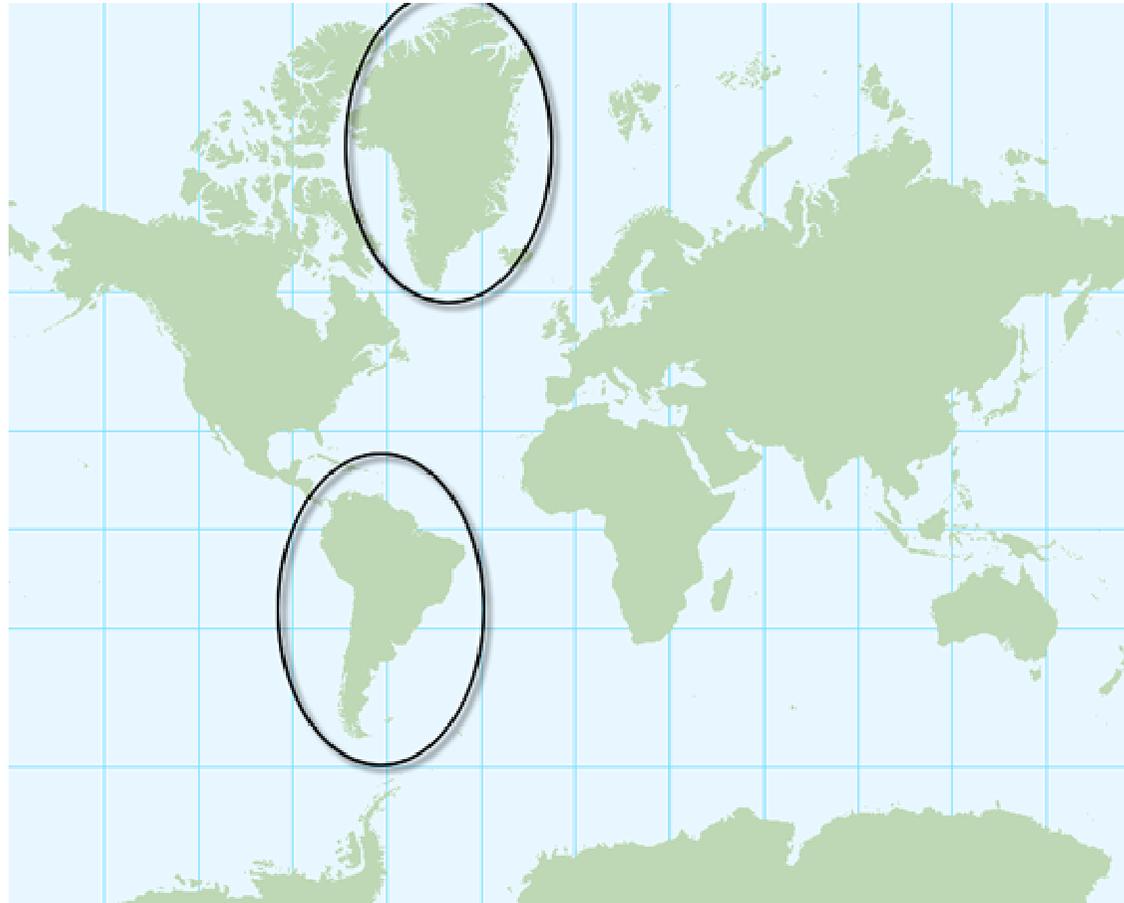

$$\lambda = \frac{x}{R} + \lambda_0$$

Mercator projection

Conformal cylindrical projection

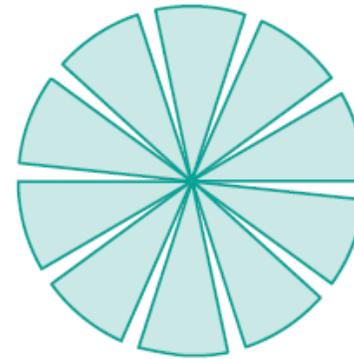

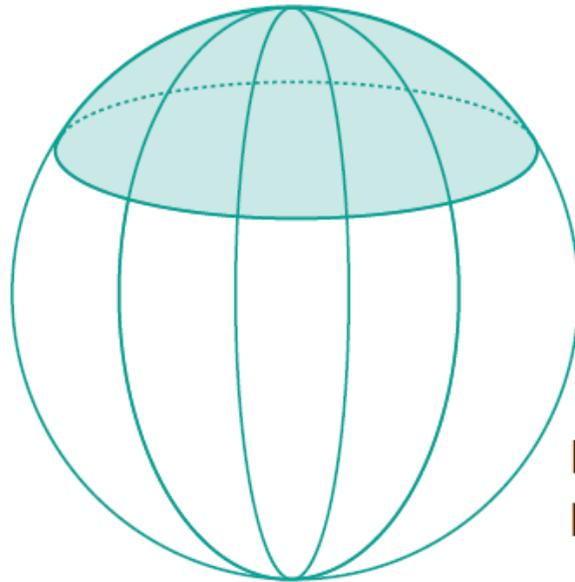

Scale distortions on the Mercator projection

Area distortions are significant towards the polar regions. Greenland appears to be larger but is only one-eighth the size of South America.

Scale distortions on a map

Distortions after flattening a part of the curved surface

Areas smaller than 25 x 25 km: NO DISTORTIONS

Areas larger than 25x25 km: ALWAYS DISTORTIONS

Any map projection is associated with scale distortions. The amount and kind of distortions depend on the type of map projection.

Map projection properties

Conformal

Angles and shapes are correctly represented (locally)

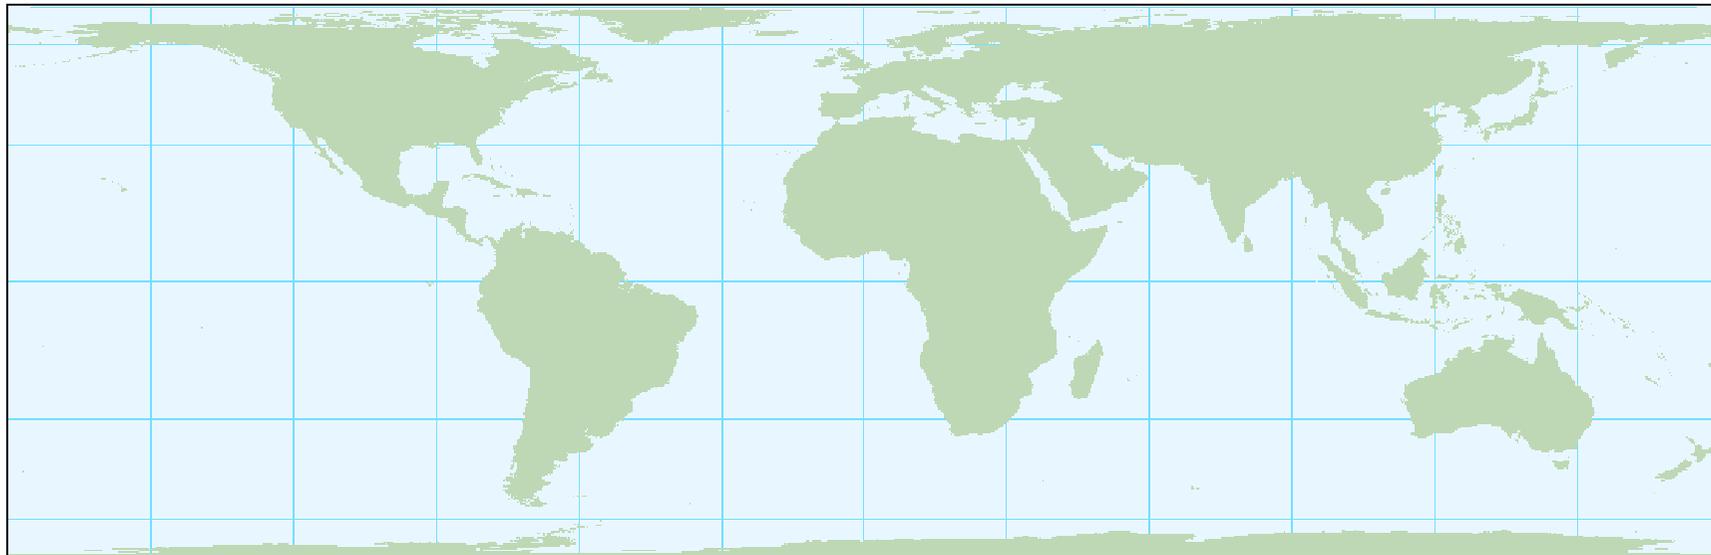

Equivalent (or equal-area)

Areas are correctly represented

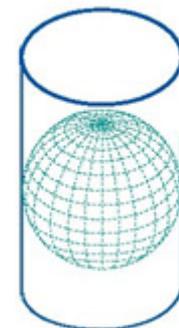

Equidistant

Distances from 1 or 2 points or along certain lines are correctly represented

Cylindrical equal-area projection

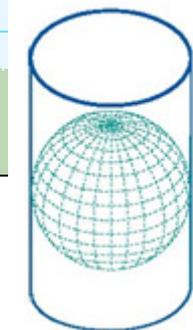

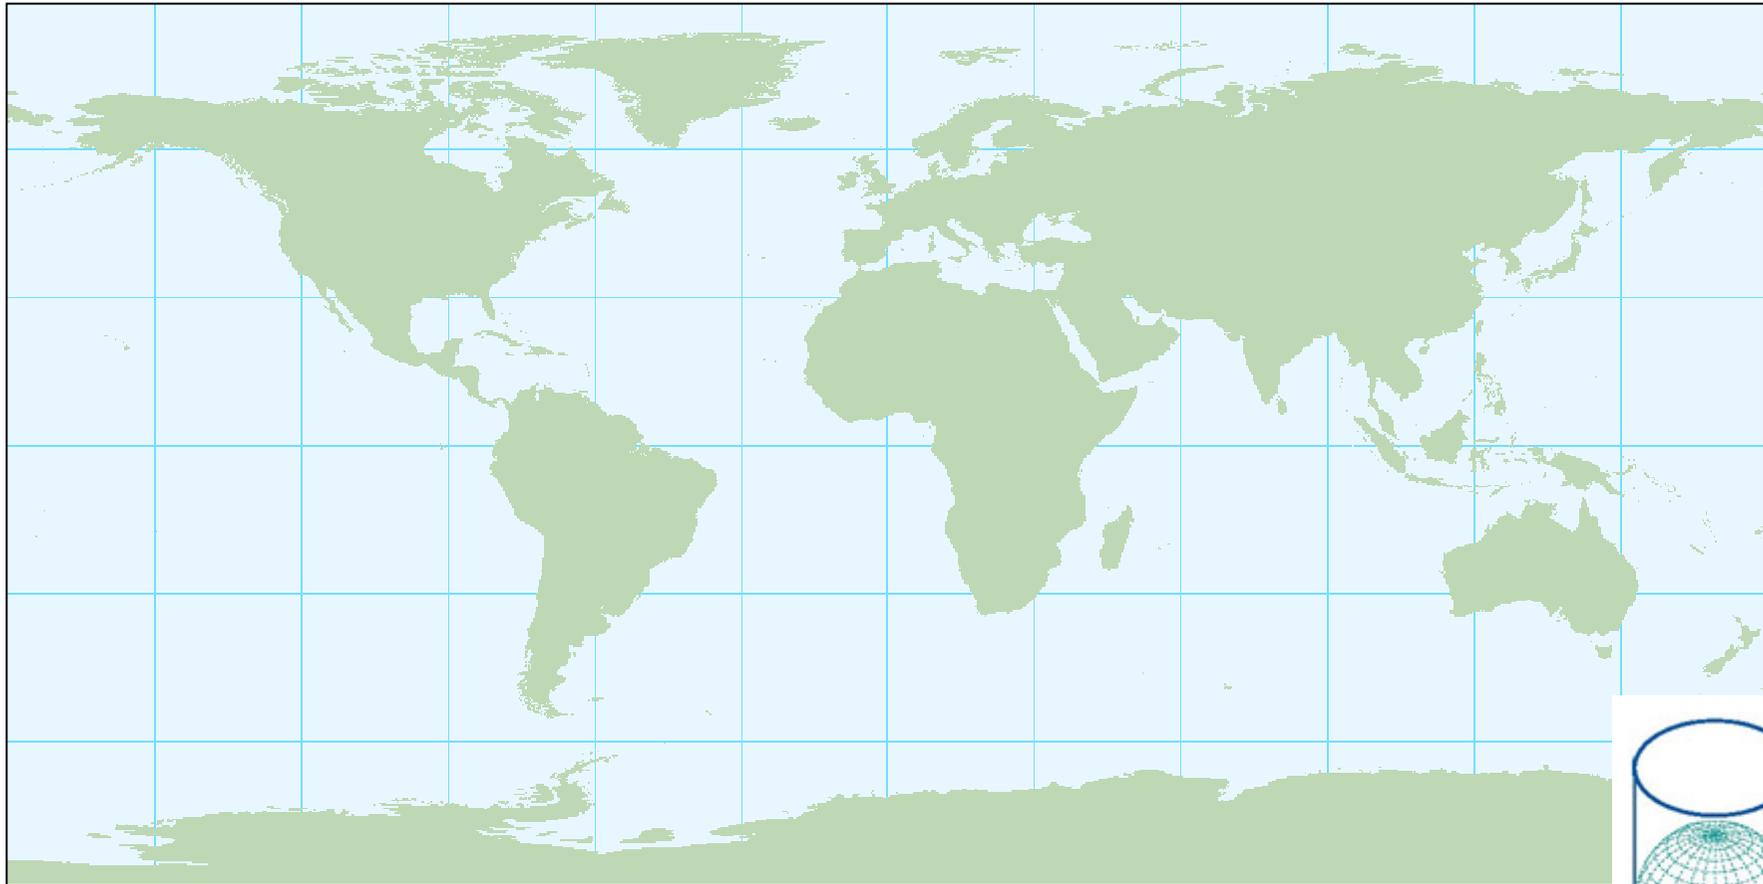

Areas are correctly represented

Equidistant cylindrical projection

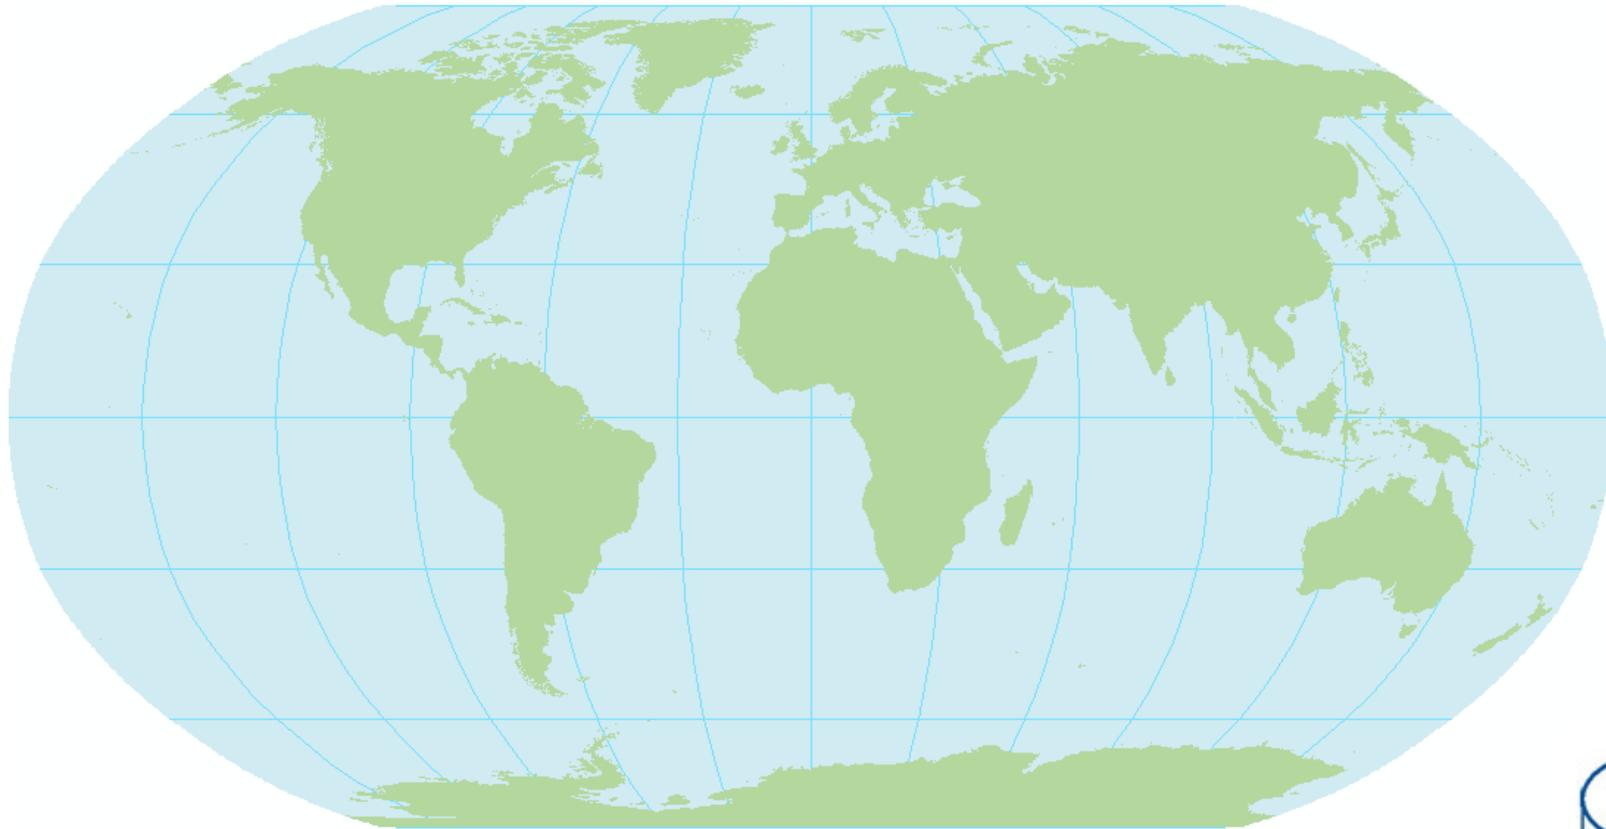

(also called Plate Carrée)

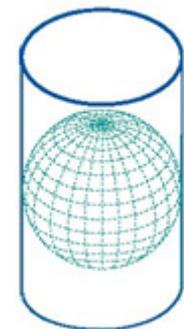

Equidistant along the meridians

Robinson projection

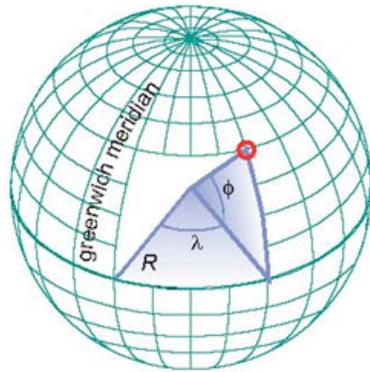

Pseudo-Cylindrical

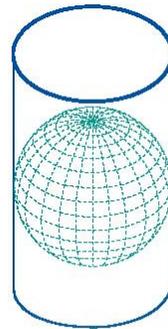

Neither conformal nor equal-area (both shape and area are reasonably well preserved)

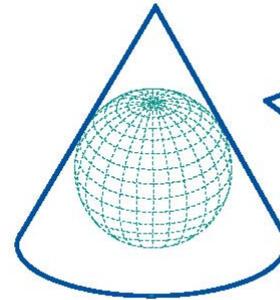

Map projection class

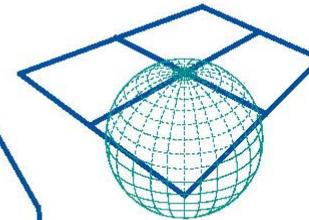

Ellipsoid

Cylindrical

Conical

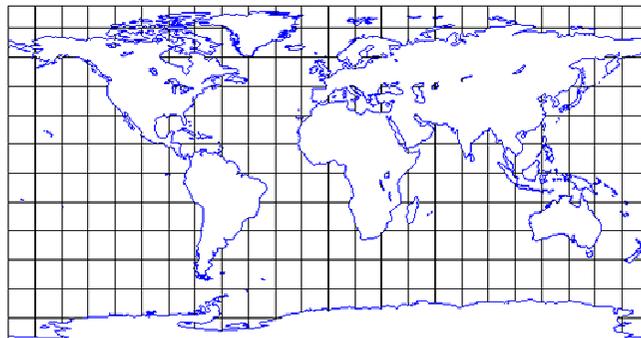

Azimuthal

Map Projection surface

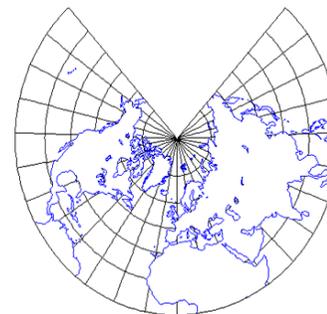

Cylindrical Projection

Mercator

Conical projection

Lambert Conformal Conical

Azimuthal projection

Stereographic projection

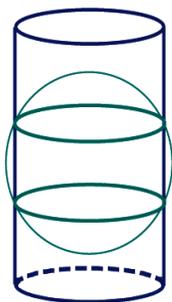

Classification of map projections

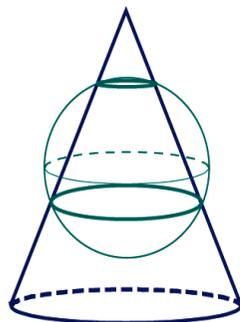

- **Class**

- Cylindrical
- Conical
- Azimuthal

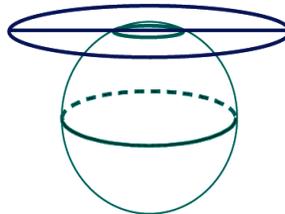

- **Secant or tangent projection plane**

Cylindrical

Conical

Azimuthal

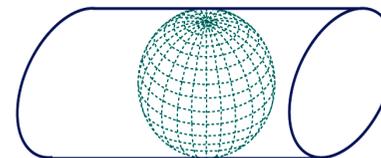

Secant projection planes

- **Property**

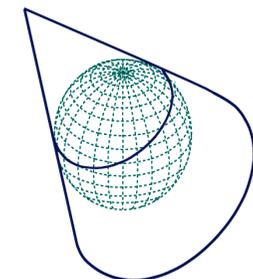

- Equivalent (or equal-area)
- Equidistant
- Conformal

- **Aspect (orientation)**

- Normal
- Oblique
- Transverse

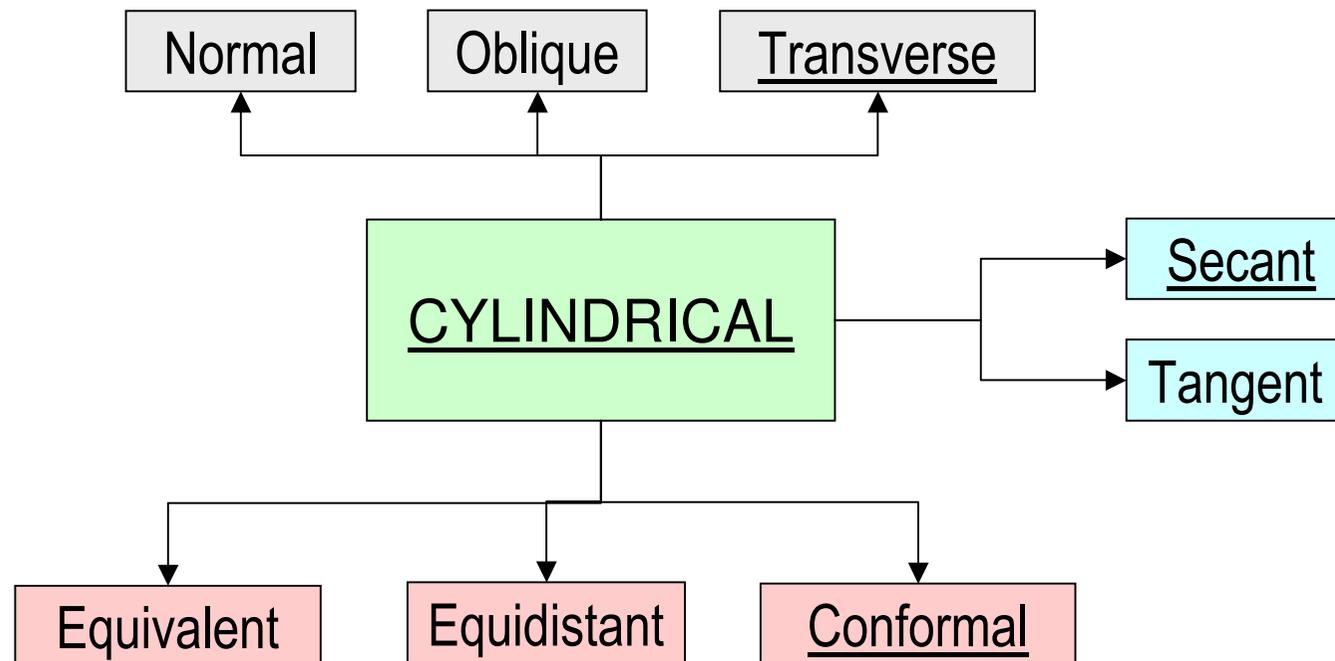

Transverse cylindrical

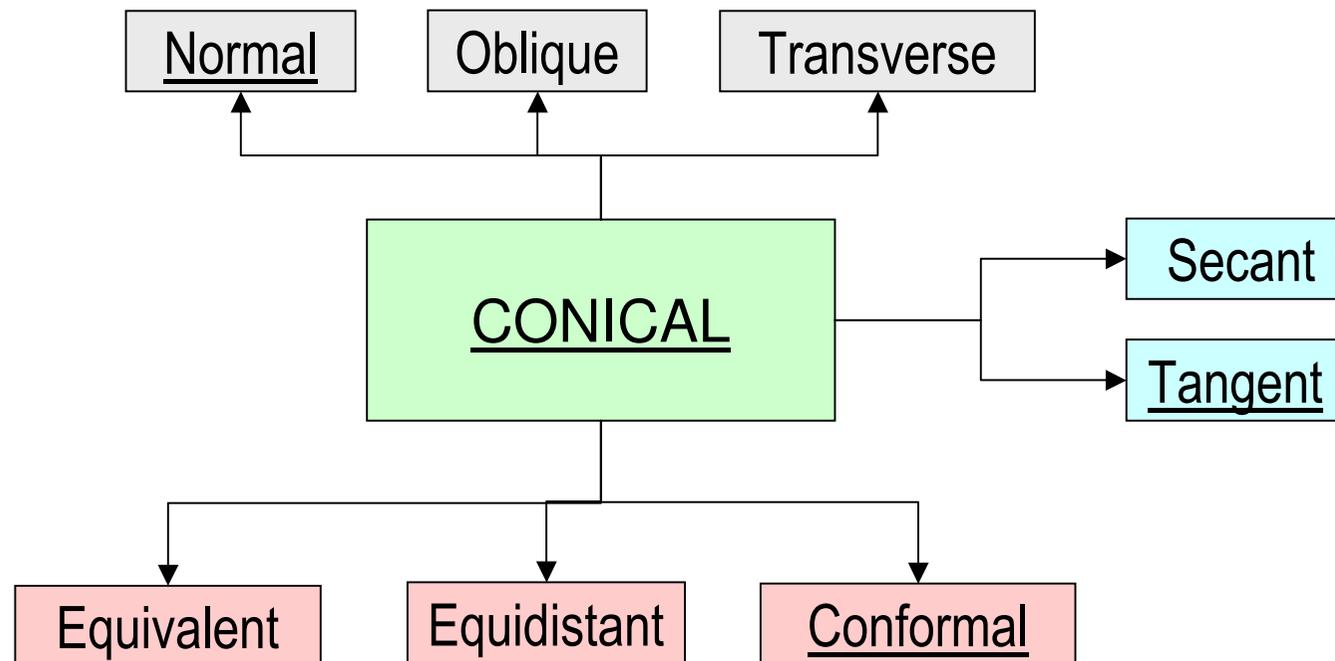

Oblique conical

Classification of map projections

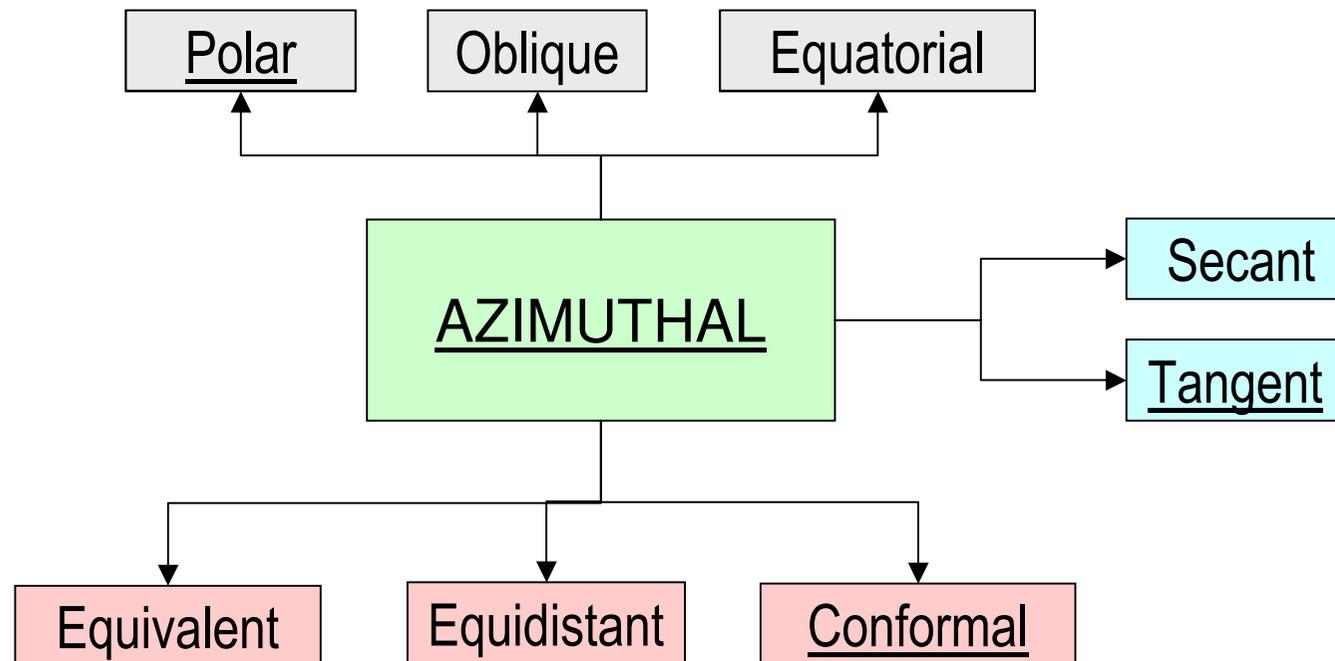

Conformal cylindrical projection with a transverse cylinder and secant projection plane (e.g. Universal Transverse Mercator)

Classification of map projections

Conformal conical projection with a normal cone and tangent projection plane (e.g. Lambert conformal conic)

Classification of map projections

Conformal azimuthal projection with a tangent polar projection Plane (e.g. Universal Polar Stereographic)

Selection of a Map projection (I)

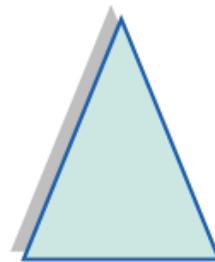

Normal *cylindrical projections* are typically used to map the World in its entirety. *Conical projections* are often used to map the different continents, while the normal *azimuthal projection* may be used to map the polar areas.

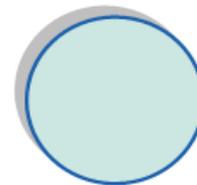

Also consider the shape of the area to be mapped:

Cylindrical

Conical

Azimuthal

Selection of a Map projection (II)

Conformal

Maps which require measuring angles (*e.g. aeronautical charts, topographic maps*)

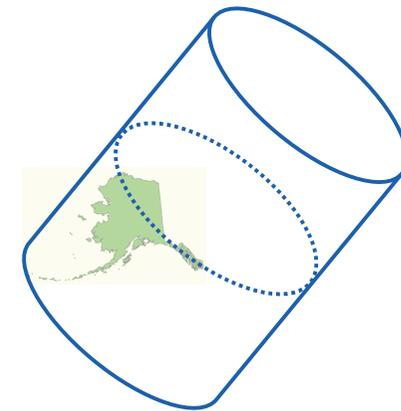

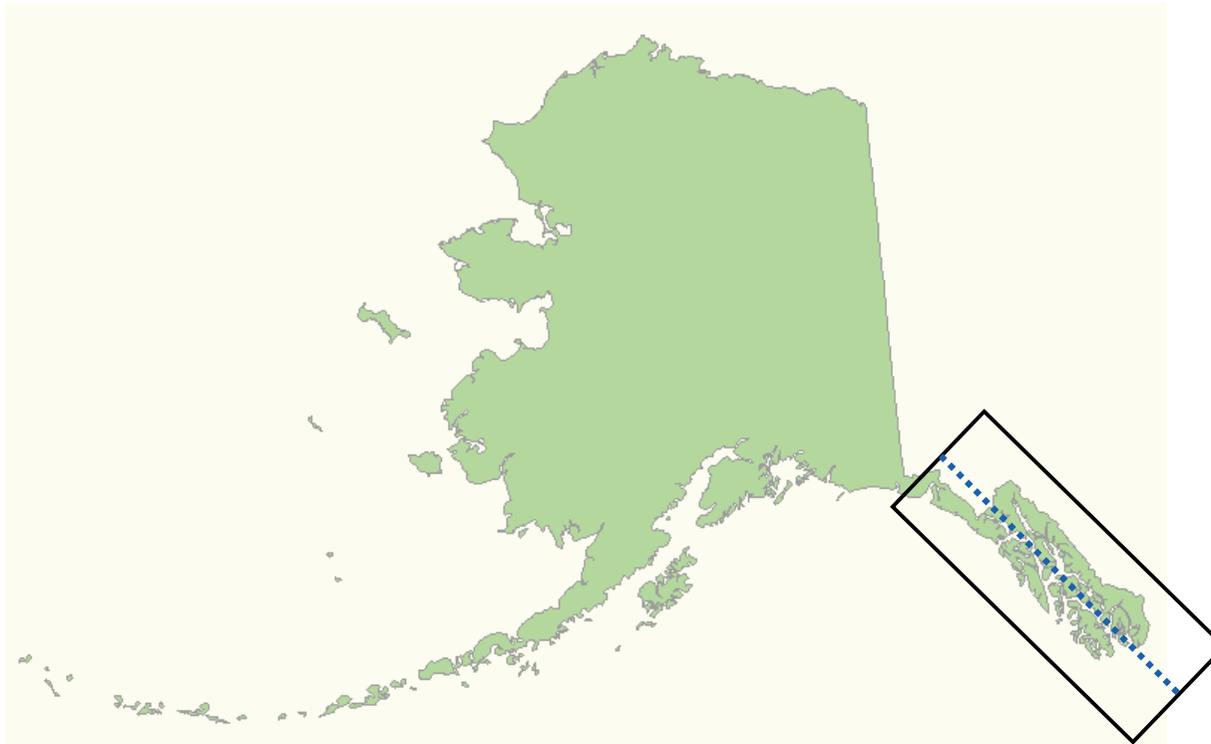

Equivalent (or equal-area)

Maps which require measuring areas (*e.g. distribution maps*)

Equidistant

Maps which require reasonable area and angle distortions (*e.g. several thematic maps*)

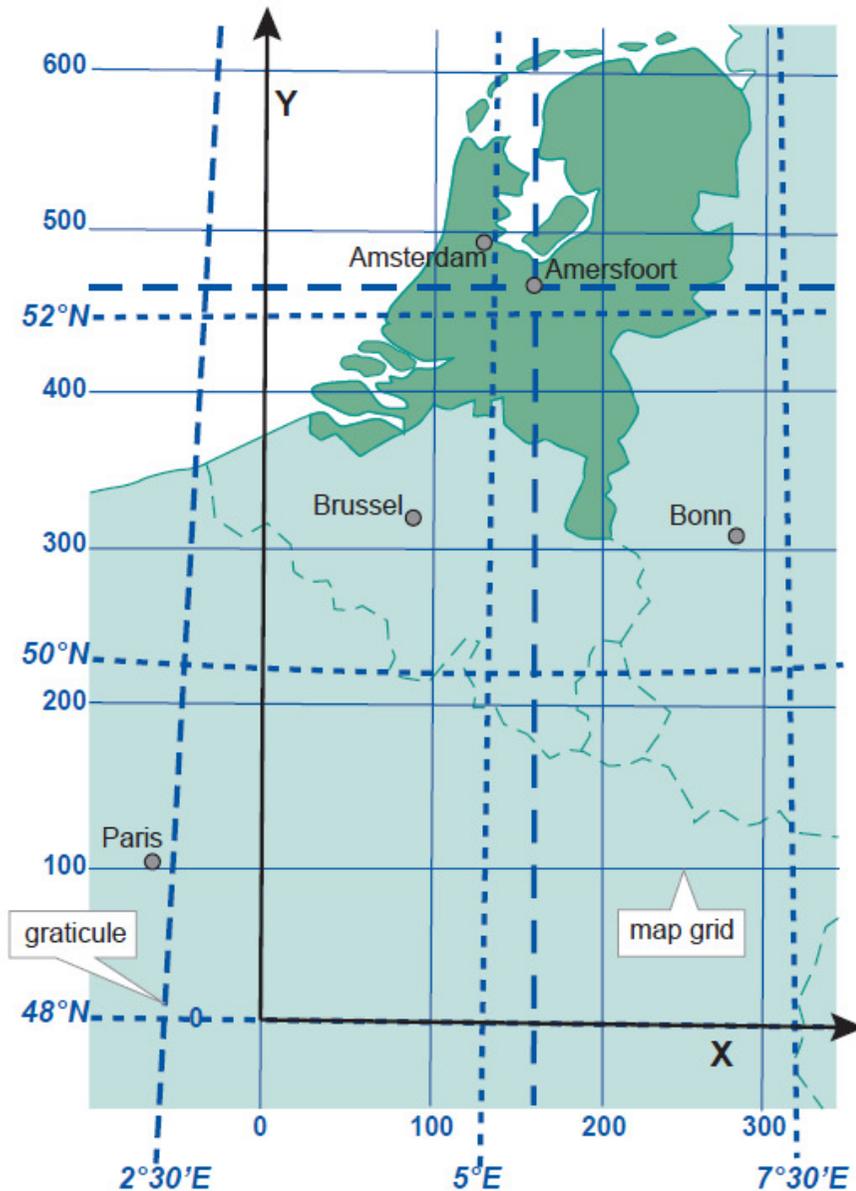

Selection of a Map projection (III)

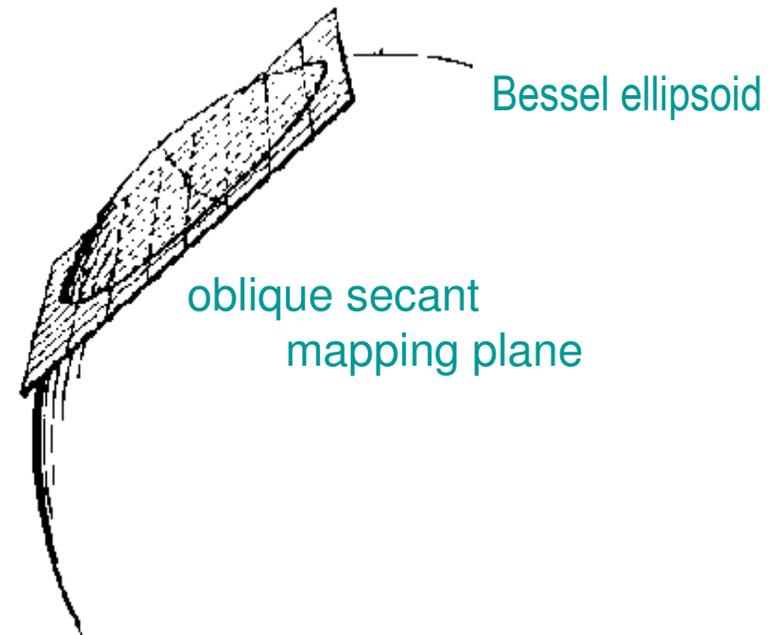

Oblique cylinder

The position (and orientation) of the projection plane is optimal when the projection plane is located along the main axis of the area to be mapped, or when the projection centre coincides with centre of the area.
