Statistical Division**

Using the GSBPM in Practice

Steven Vale
UNECE
steven.vale@un.org

Introduction

- ❖ The original aim of the GSBPM was to standardise terminology for discussions on statistical metadata systems and processes
- ❖ But now it has many other uses:
(Quotes from GSBPM 5.1)

Documentation

- ❖ “The GSBPM can provide a structure for organising and storing documentation within an organisation, promoting standardisation and the identification of good practices”

Process quality management

- ❖ “If a benchmarking approach to process quality assessment is to be successful, it is necessary to standardise processes as much as possible. The GSBPM provides a mechanism to facilitate this”

Integrating metadata and quality

- ❖ “The common framework provided by the GSBPM can help to integrate international work on statistical metadata with that on data quality by providing a common framework and common to describe the statistical business process”

Mapping Statistical Production Processes to GSBPM

- ❖ All processes that result in data outputs can be mapped to the GSBPM

Example 1

- ❖ Australian project to improve production of prices data
- ❖ Identified activities within GSBPM sub-processes
- ❖ Some phases “out of scope”

Quality Management / Metadata Management

1 Specify Needs	2 Design	3 Build	4 Collect	5 Process	6 Analyse	7 Disseminate	8 Archive	9 Evaluate
1.1 Determine needs for information <ul style="list-style-type: none"> Design Price Index characteristics Design Price Index classification/s (structures) 	2.1 Design outputs <ul style="list-style-type: none"> Design Price Index characteristics Design Price Index classification/s (structures) Design weighting patterns Design Price Index measures Design Price Index products 	3.1 Build data collection instrument 3.2 Build or enhance process components	4.1 Select sample <ul style="list-style-type: none"> Establish frame according to frame design Select sample according to sample design Establish maintenance procedures for frame and sample Maintain frame and sample 	5.1 Integrate data <ul style="list-style-type: none"> Match data records Prioritise data records Eliminate duplicate data records Anonymise data records 	6.1 Prepare draft outputs <ul style="list-style-type: none"> Record quality characteristics for each Price Index number produced Produce data visualisation outputs 	7.1 Update output systems <ul style="list-style-type: none"> Load data and metadata to output data stores Resolve issues Validate and sign off 	8.1 Define archive rules 8.2 Manage archive repository	9.1 Gather evaluation inputs <ul style="list-style-type: none"> Determine persons / team to conduct evaluation Gather inputs required for evaluation
1.2 Consult and confirm needs	2.2 Design variable descriptions <ul style="list-style-type: none"> Design variables collected via data collection instrument Design derived variables and transformation formula 	3.3 Configure work flows	4.2 Set up collection <ul style="list-style-type: none"> Investigate and establish collection strategy for sample and administrative data Establish training regime for staff to enable data collection Check data collection tools, technology and processes are available and ready for use Establish and review security procedures for data collection Prepare data collection systems for collection and receipt of data 	5.2 Classify and code <ul style="list-style-type: none"> Classify data according to pre-defined collection requirements and definitions Assign codes to data items according to classification 	6.2 Variable outputs <ul style="list-style-type: none"> Validate Price Index outputs against body of knowledge Validate Price Index quality characteristics against a quality framework Macro analyse Price Index outputs Investigate inconsistencies between macro data and body of knowledge 	7.2 Produce dissemination reports <ul style="list-style-type: none"> Prepare draft of dissemination products Finalise dissemination products Validate and Sign off release of dissemination products 	8.3 Preserve data and associated metadata	9.2 Conduct evaluation <ul style="list-style-type: none"> Conduct detailed analysis and evaluation of all gathered inputs Produce report detailing findings and recommendations for improvement
1.3 Establish output objectives	2.3 Design data collection methodology <ul style="list-style-type: none"> Determine suitable methods for data collection Design data collection instrument Design formal agreements to collect data Design provider management method 	3.4 Test production system	4.3 Run collection <ul style="list-style-type: none"> Establish provider contact procedures and SLA's Collect data according to schedules Follow up with providers for data Record provider contact information and response rates Record and resolve queries by providers and data collection staff 	5.3 Review, validate and edit <ul style="list-style-type: none"> Detect and treat all Quality Adjustments Detect and treat all significant anomalous data 	6.3 Scrutinise and explain <ul style="list-style-type: none"> Inspect macro statistical outputs Explain macro statistical outputs against body of knowledge 	7.3 Manage release of dissemination products <ul style="list-style-type: none"> Brief authorised stakeholders 	8.4 Dispose of data and associated metadata	9.3 Agree on action plan <ul style="list-style-type: none"> Present evaluation report to appropriate corporate consultative boards for discussion Agree on action plan for either implementing or amending the proposed recommendations Set up metrics to monitor the success and benefits derived from implementing recommendations
1.4 Identify concepts	2.4 Design frame and sample methodology <ul style="list-style-type: none"> Design survey frame methodology Design survey sample methodology 	3.5 Test statistical business process	4.4 Finalise collection <ul style="list-style-type: none"> Convert data for data loading Upload data into processing systems Load metadata into metadata storage systems Archive paper forms, and administrative data sets 	5.4 Impute <ul style="list-style-type: none"> Logical imputation Historical imputation Seasonal imputation Subjective imputation Mean imputation Regression Donor Imputation 	6.4 Apply disclosure control <ul style="list-style-type: none"> Assess likelihood of identification of data Recommend protection techniques for data Apply protection techniques to data 	7.4 Promote dissemination products <ul style="list-style-type: none"> Release dissemination products Release other products 		
1.5 Check data availability	2.5 Design statistical processing methodology <ul style="list-style-type: none"> Design statistical method for integrating data validating data imputing data calculating aggregates micro editing macro editing classifying and coding data calculating weights finalising data 	3.6 Finalise production system		5.5 Derive new variables & statistical units <ul style="list-style-type: none"> Derive a final price for reference data Derive a final price for pre-processed data Derive a final price for all Price Observations collected Derive a current Price Relative for all Price Observations which have a Base period Price recorded 	6.5 Finalise outputs <ul style="list-style-type: none"> Apply consistency checks Produce clearance documentation Set level of data release Conduct clearance meetings with senior management Clear data for release 	7.5 Manage user support <ul style="list-style-type: none"> Record Query in Single repository Categorise Link Query by Release Period Index/Component Resolve Query Refer to Delegate Advise response to client Record response 		
1.6 Prepare business case	2.6 Design production systems and workflow <ul style="list-style-type: none"> Determine the work flows from data collection to dissemination of outputs Define criteria to assess the quality of the production systems and work flows Design systems / work flows integration, migration and roll forward processes Determine fitness for purpose of existing production systems and work flows Undertake gap analysis to determine re-use of existing systems and work flows 			5.6 Calculate weights <ul style="list-style-type: none"> Calculate Reporting Unit sample weight Calculate Price Observation sample weight 				
				5.7 Calculate aggregates <ul style="list-style-type: none"> Calculate the Raw Index, C Index, Average Price and Median for Price Samples using assigned Compilation method Price update previous period value aggregates for all elementary aggregates Sum all child value aggregates for each upper level Price Index component 				
				5.8 Finalise data files <ul style="list-style-type: none"> Calculate all additional aggregate data for Price Index (P Indexes, points contribution & change, percentage change) 				

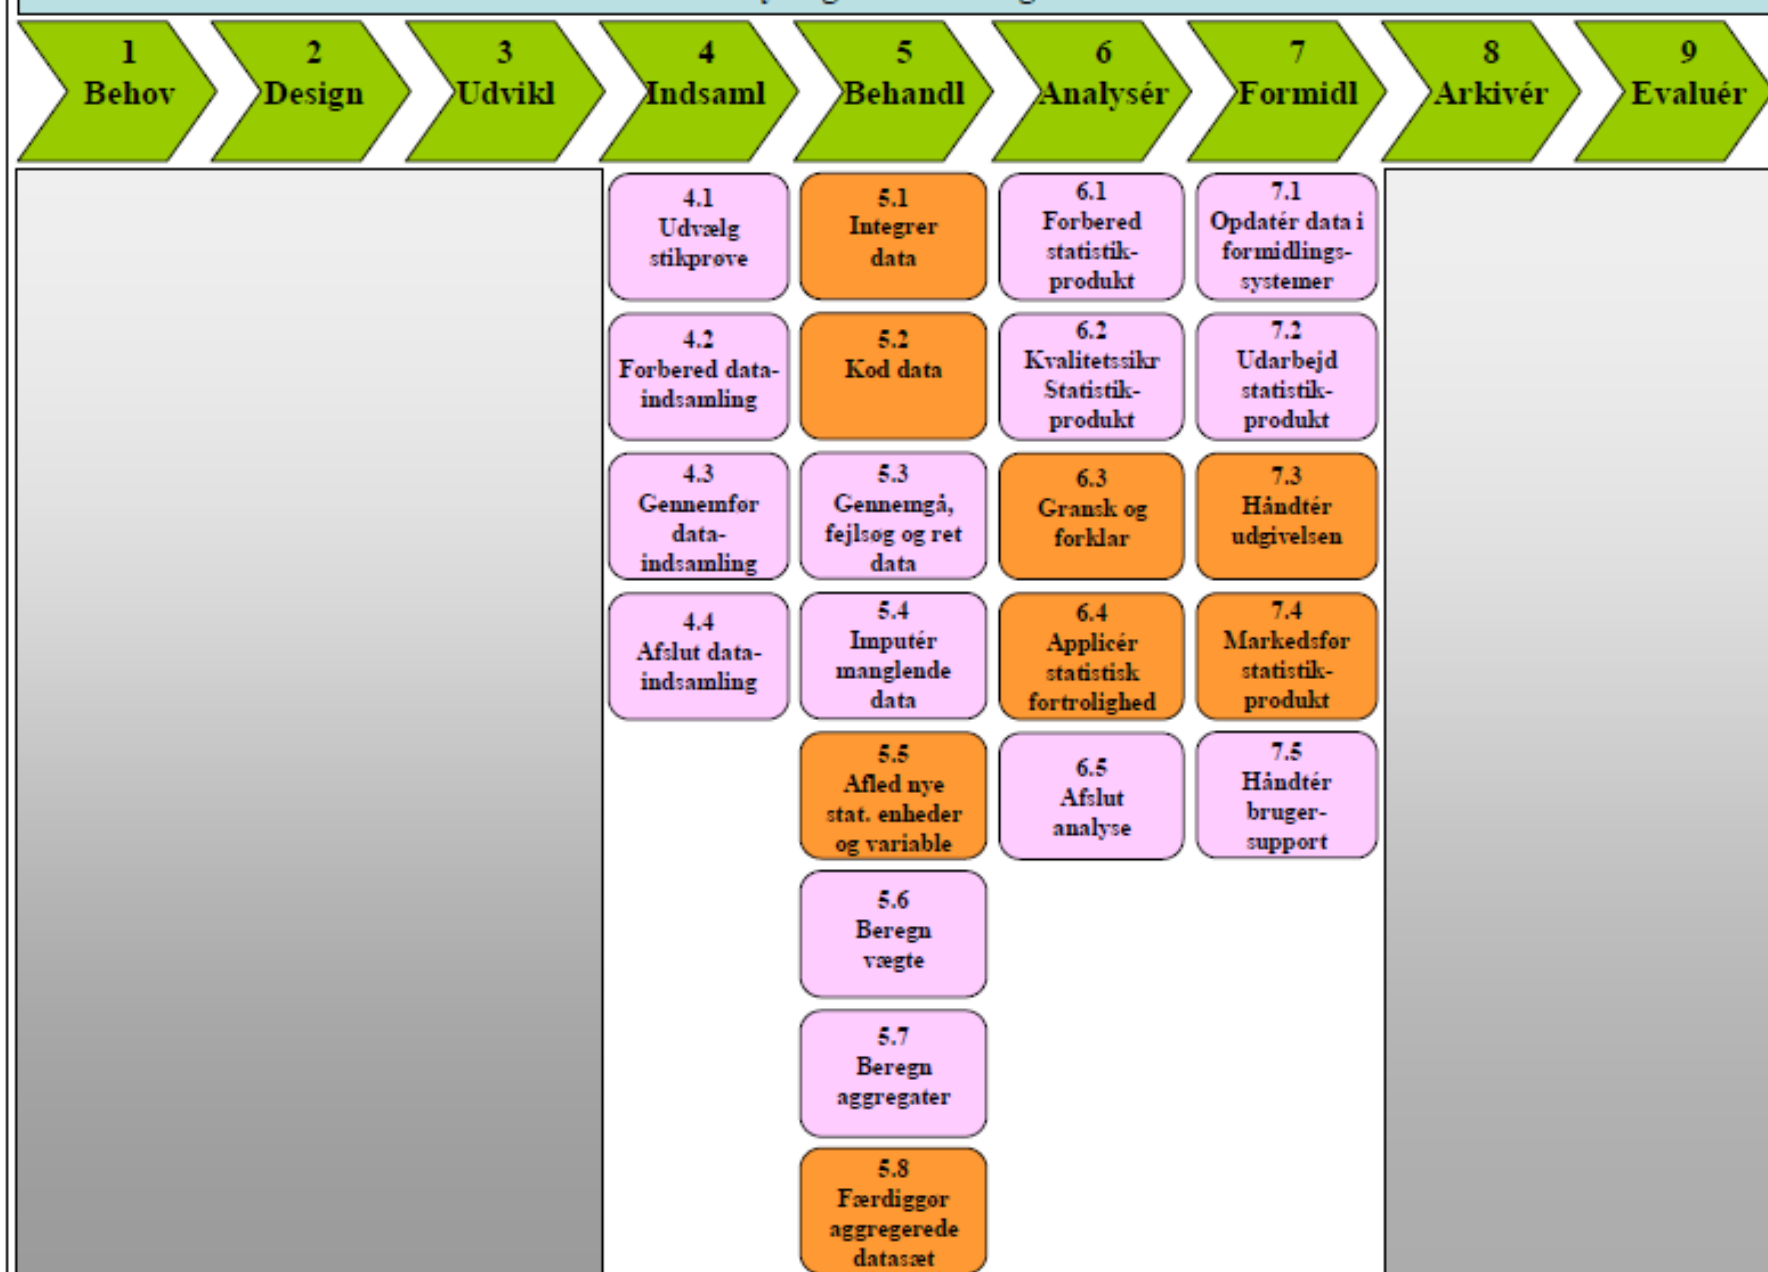

DRAFT

Example 2

- ❖ Denmark – quarterly survey on employment in construction
- ❖ Established, regular survey
 - Just phases 4 to 7

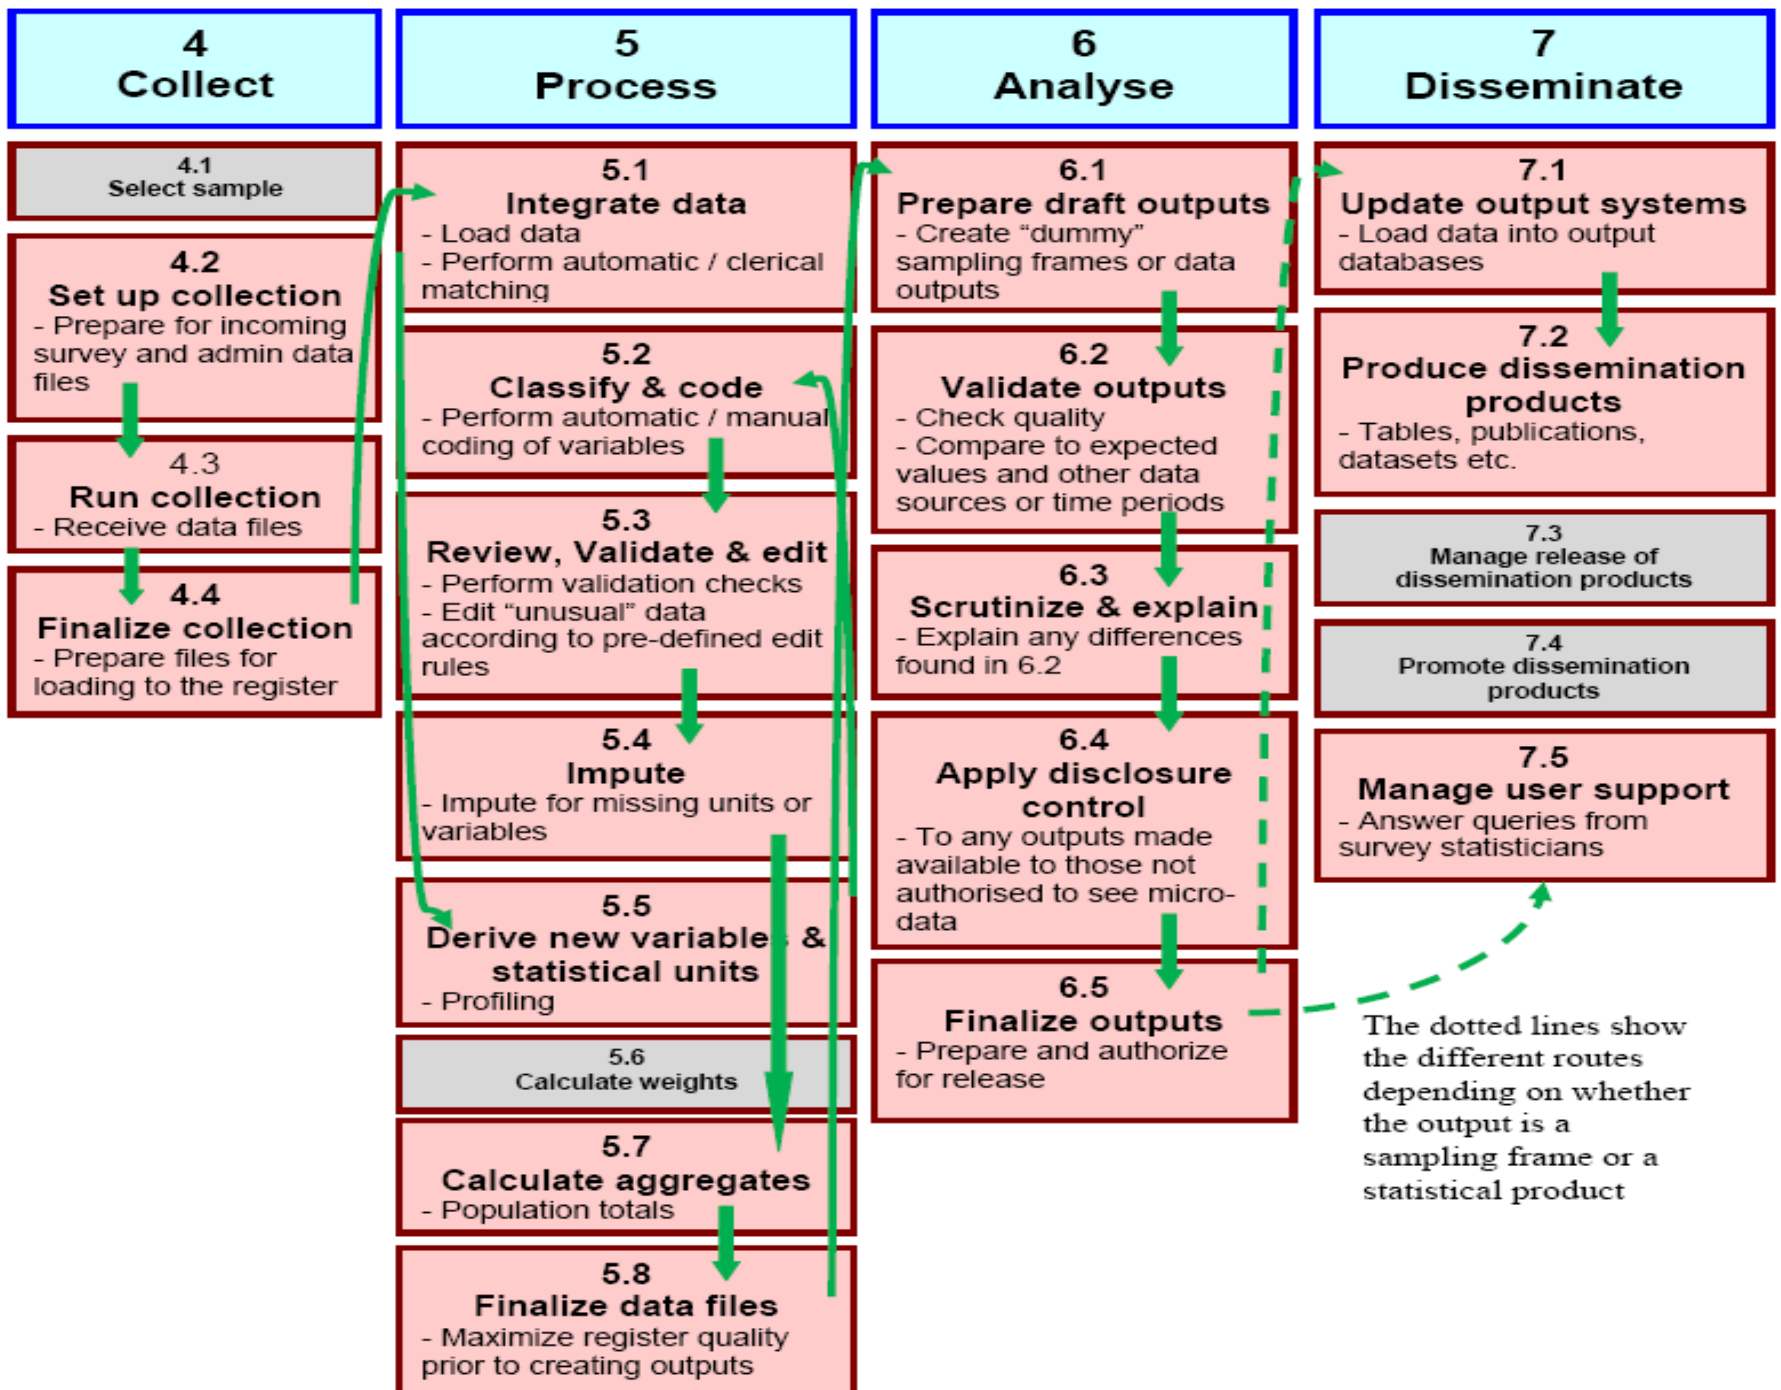

METIS phases for: Employment in construction industries (marked with pink)

Kvalitetsstyring / Håndtering af metadata

Example 3

- ❖ Mapping register processes to GSBPM
- ❖ Register maintenance is a continuous activity, not a single process
- ❖ But statistical registers have:
 - Inputs “collected” from different sources
 - A sequence of processing and analysis
 - Outputs – statistics and sampling frames
- ❖ Therefore, register maintenance is similar to other statistical production

Why do this?

There are practical benefits:

- Standardisation of terminology
- Standard framework for benchmarking
- Facilitates use of common tools / methods
- Efficiency savings
- Tool for managing process quality

Documentation

Example: Armenia - 2011 Population Census

Phase 5 – Process

5.1. Integrate data.

On the reason that in Armenia the census data are collected from one source, there is no necessity to integrate data collected from different sources. The data integration is performed after the data coding and data entry. As the result of data entry, the text files are created, each of them corresponds to one enumeration area. After the data entry completion, all the files are combined, and the database is created for further cleaning and analysis. The data integration can be performed also before the data entry completion for the processing software testing. For the data entry as well as integration the software CPro is used. Duration of the data integration is very few seconds. Responsible for this sub-process is the Division of information technology and programming of the Population census department. The sub-process of data integration is also used in other processes of data production.

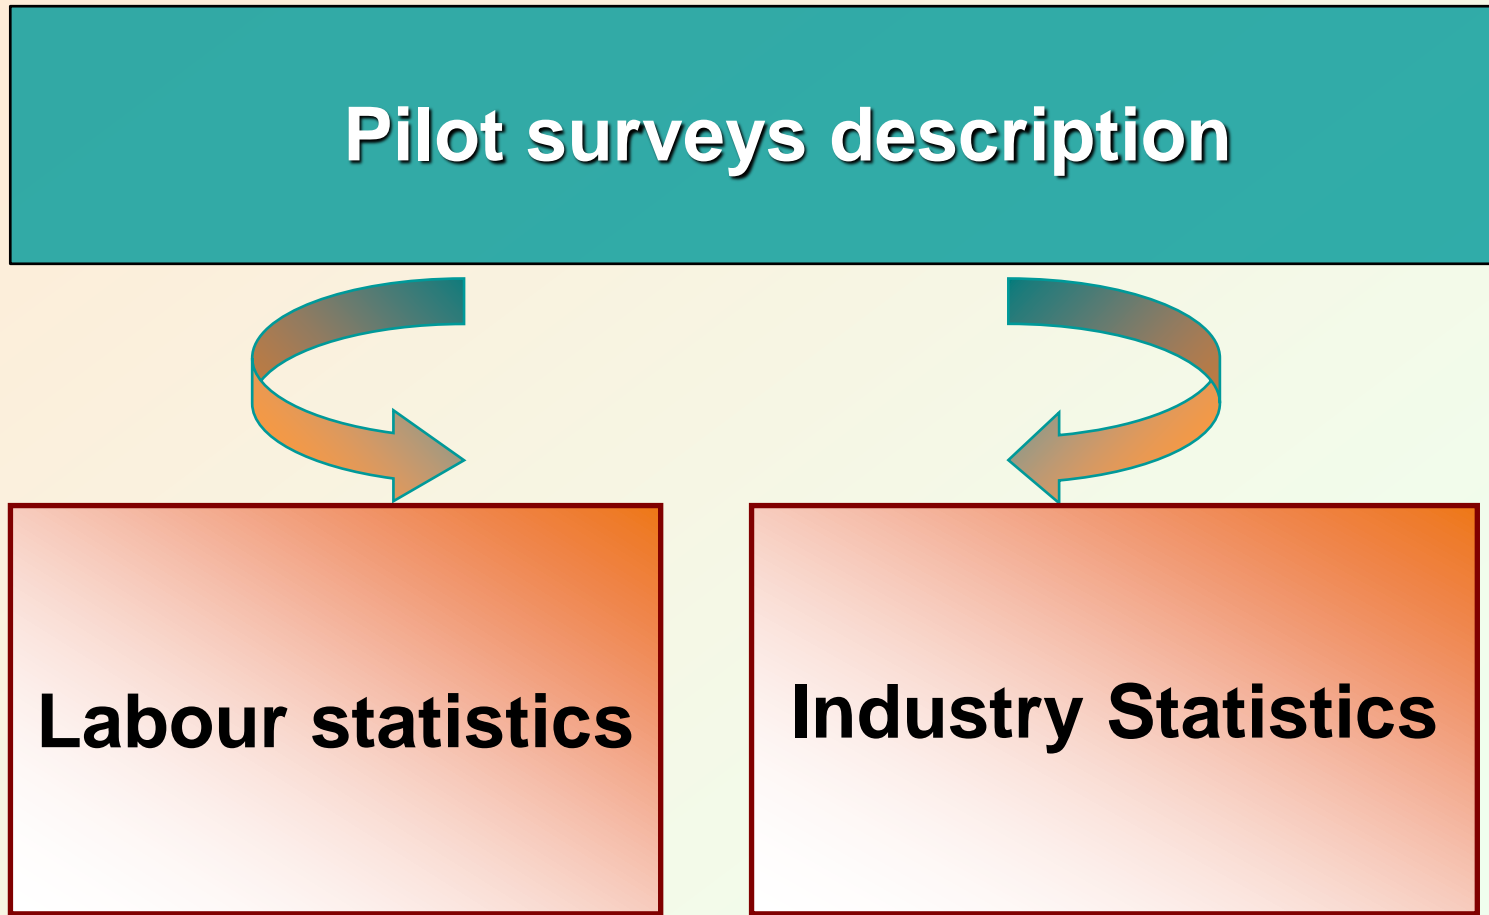

5.2. Classify and code

The works on classification and coding were launched in parallel with the information acceptance at the Department of census. Each portfolio corresponds to one

Similar approaches are
now widely used in
many other countries

Belarus: Using GSBPM 5.0 to describe the existing statistical production processes

Results:

Identification of **gaps** in the existing processes

Lack of necessary documentation

Existence of **unsettled** processes

Purpose of documentation

- ❖ Needs to be agreed before work starts!
- ❖ Examples:
 - Knowledge management
 - Succession planning
 - Standardisation – understanding the starting point
 - Metadata / quality management
 - International reporting

What to document?

- ❖ For the whole process:
 - Summary of purpose
 - Sources, outputs and users
 - Links to other processes
 - Costs?

What to document?

- ❖ For GSBPM sub-processes:
 - Purpose
 - Inputs and outputs (use GSIM?)
 - Tools and methods
 - Quality criteria
 - ◆ When to move on to next sub-process
 - Costs?

Documentation

Comparison

Efficiency!

How to begin?

- Read the GSBPM sub process descriptions:

2.3. Design collection

This sub-process determines the most appropriate collection method(s) and instrument(s). The actual activities in this sub-process will vary according to the type of collection instruments required, which can include computer assisted interviewing, paper questionnaires, administrative data interfaces and data integration techniques. This sub-process includes the design of collection instruments, questions and response templates (in conjunction with the variables and statistical classifications designed in sub-process 2.2 (Design variable descriptions)). It also includes the design of any formal agreements relating to data supply, such as memoranda of understanding, and confirmation of the legal basis for the data collection. This sub-process is enabled by tools such as question libraries (to facilitate the reuse of questions and related attributes), questionnaire tools (to enable the quick and easy compilation of questions into formats suitable for cognitive testing) and agreement templates (to help standardise terms and conditions). This sub-process also includes the design of process-specific provider management systems.

How to begin?

- Bring together all colleagues who are involved in the process
- Agree and describe the steps needed to complete the process
- Document them!
- Benefits include increased transparency and identifying areas for improvement
- Discussions often bring new ideas

Resource planning

Indicative Current and Future Effort Distribution

GSBPM quality indicators

- ❖ Developed by task team
 - Canada, Hungary, Italy, Turkey, Eurostat, UNECE
- ❖ Generic quality indicators for each GSBPM sub-process
 - Processes based on surveys: 2016
 - Expanded to include administrative data: 2017
- ❖ Consistent with existing frameworks:
 - UN NQAF, ESS Code of Practice / QAF

UNECE

**Quality Indicators for the Generic Statistical Business
Process Model (GSBPM) - For Statistics derived from
Surveys and Administrative Data Sources**

(Version 2.0, October 2017)

<https://statswiki.unece.org/display/GSBPM/Quality+Indicators>

Uses of the Quality Indicators

- To provide a standard framework / common terminology to support a **process-oriented approach** to Quality Management
- To **rationalise quality work** within an NSO
- To define a mid-term quality policy
 - Set quality targets for a 3-5 year period

Example: 4.4 Finalise Collection

Quality Dimension	Indicator
Cost-effectiveness	<p>Discrepancy between planned versus actual collection costs</p> <p>Percentage of collection activities that met requirements (assessed through analysis of paradata)</p>
Accuracy and reliability	Outgoing error rates; estimate of non-sampling error
Accuracy and reliability	<p>The rate of over-coverage:</p> <p>The proportion of units accessible via the frame that do not belong to the target population (are out-of-scope).</p>

Quality and Metadata Management

- ❖ Needed at many different levels:
 - Process / sub-process level – GSBPM
 - Organisation level – GAMS0
