

C.4 Merchanting and Factoryless Producers; Clarifying Negative Exports in Merchanting; and Merchanting of Services: Outcome of Global Consultation¹

The global consultation showed wide support for all proposals concerning factoryless goods producers (FGP) arrangements. On the proposed supplementary component(s) under the Goods Account, respondents were evenly split between the two options. Strong support was shown for the reasoning behind the recording of negative exports in merchanting of goods and recording of fees separately from the relevant services. Although proposed treatment of bundled services was supported by a slight majority, challenges from its practical implementation and risks of asymmetries were also noted by several respondents. Regarding the practical aspects of implementation, the majority of the respondents cited capacity and source data constraints in capturing the phenomena of global manufacturing arrangements. Owing to the complexity of the issue, a relatively small number of countries showed willingness to engage in experimental exercises for producing FGP estimates. Views on the availability of information allowing for splitting of the packages—such as tour operators—into the major components were divided.

The GN C.4 is presented to the IMF Committee on Balance of Payments Statistics (the Committee) and the Advisory Expert Group on National Accounts (AEG) for final decision.

OVERVIEW

1. Responses reflect the views of both the balance of payments and the national accounts communities. Of the sixty-six participating economies, about 40 percent provided a coordinated response (27 responses) for balance of payments and national accounts, 23 submitted a response for balance of payments only, and 16 for national accounts only (Figure 1). European countries had the largest participation (44 percent). The consultation ran from September 23 to October 21, 2021.

CONCEPTUAL ISSUES

Three main conceptual issues discussed in the guidance note are (i) disentangling the transactions related to factoryless goods producers (FGPs) in global manufacturing arrangements and proposing adequate treatments; (ii) clarifying the rationale behind negative recording of merchanting of goods; and (iii) clarifying the existing guidance on the definition and treatment of merchanting of services.

2. The proposals concerning the FGP arrangements received wide support. A large majority agreed with the proposed recordings of the output of the contractor as a Good under the FGP arrangement and as a Service under a processing arrangement (Figure 3/). The classification of FGPs should not distinguish between affiliated and non-affiliated enterprises (Figure 4/). While a thin majority (52 percent) favored classifying the activities related to FGP as manufacturing and recording their transactions on a gross basis (Figure 2), 75 percent supported introducing supplementary component(s)

¹ Prepared by Ms. Silvia Matei (IMF – CATT co-Secretariat) and reviewed by Ms. Maria Borga (IMF – CATT co-Chair) and Ms. Jennifer Ribarsky (IMF – GZTT Secretariat).

under the Goods Account though evenly split between the two options² (Figure 5/). There was a broad agreement on the usefulness of the decision tree (Figure 6). However, to adequately respond to the diversity of situations and to bring clarity to the process, respondents considered that it should cover a wider range of aspects.

3. The large majority (Figure 8) agreed with the reasoning behind the compromise on the recording of *negative exports in merchanting of goods* and encouraged inclusion of additional explanations in the new standards.

4. A majority of respondents supported the proposals on the concept of “*merchanting of services*” (Figure 9) and found the recording of fees separately from the relevant services as appropriate (Figure 10). The proposed treatment of *bundled services* was found conceptually acceptable by a slight majority (around 60 percent) of respondents (Figure 11) and beneficial for improving consistency of BPM/SNA with the Tourism Satellite Account (TSA). However, challenges from its practical implementation and risks of asymmetries were also noted by several respondents.

CURRENT COMPILATION PRACTICES

5. Most respondents indicated that their institutions were unable to identify the relevant units engaged in global manufacturing arrangements and to prepare related estimates (Figure 12).

About 60 percent of respondents indicated that global manufacturing arrangements were of high or medium relevance in their economy. The remaining 40 percent described it as of low relevance for their economies (Figure 7). It was widely acknowledged that the phenomenon of globalization is gaining momentum a view equally shared by countries that have not yet developed the capacity to quantify its extent. At the same time, only a relatively small number of countries (about 14³) are ready to engage in experimental exercises to estimate the proposed supplementary items related to FGP activities but just half of them showed interest in seeking advice on implementation (Figure 14).

6. On practical grounds, most respondents considered the global production arrangements as complex and cited difficulties in capturing it. Major practical challenges identified by respondents with regard to producing estimates for the FGP (Figure 13) are related to (i) difficulties in identifying the enterprises engaged in global production arrangements in the main registers and complementary data sources, including Customs records; further, the constraints in detecting the ownership of material inputs is highlighted; and (ii) the lack of capacity to develop adequate data collection instruments. With regard to trade-related intermediation services, several respondents identified weaknesses in data sources, to separate the intermediation fee from the actual service components and sometimes from goods or other transactions with affiliated companies. Other respondents noted difficulties in identifying and accessing information on global service intermediation arrangements, as well as the implicit fees charged by the digital intermediation platforms, in particular for the households sector.

² Option 1 proposes one supplementary component under the Goods/General merchandise; Option 2 proposes supplementary components distributed between the General merchandise and the Net export of goods under merchanting.

³ In two cases, Colombia and Philippines, both the Central Bank and the Statistical Office volunteered.

7. For bundled products, some respondents indicated that major items, such as passenger transport, accommodation, etc., for tour operators, can be separated based on information from available sources, while others found it difficult to unbundle and suggested allocating the whole amount to the main service category, usually travel. Important implications were noted for the European countries currently following the *ESA 2010*, for which bundled packages are recorded as one product in national accounts as well as for the harmonized consumer price index and the household budget surveys; however, these components have to be unbundled for TSA purposes.

Figure 2: Views on classifying the activities related to FGP as manufacturing and recording their transactions on a gross basis

Gross recording of FGP transactions was found conceptually sound by many reporters. Main reasons cited include the profile of the activities of FGPs being closely connected to manufacturing rather than trade and their control of the manufacturing process (provision of IPP, control of production processes, involvement in the final goods distribution, etc.). However, further research is needed to fully comprehend how this will work out in practice. Those with opposing views consider that classifying FGP activities as manufacturing would result in an overestimation of local manufacturing activities when comparing the output or gross value added by sector. The provision of IPP was not considered sufficient to conclude that the principal is engaged in manufacturing activities, which are carried out by foreign contractors.

Further clarification should be brought on issues such as (i) marketing assets (e.g., trademarks) as IPP; and (ii) potential classification of SPEs as FGPs. Also, pragmatic considerations were suggested, such as: (i) question whether the user benefit by introducing a sub-item under the Goods; (ii) determining whether the focus should be on distinguishing the domestic vs. cross-border transactions or between production/ manufacturing and pure trade; (iii) potential risk that a non-homogenous treatment of FGPs could increase the asymmetries between countries.

Figure 3: Summary views on the proposed recordings of the output of the contractor – as a Good under the FGP arrangement and as a Service under a processing arrangement

Many responders agreed with the distinction from a conceptual perspective. However, big doubts were expressed again about the practical implementation stressing the difficulty of getting the information needed to make the distinction between the FGP, where the ownership of raw materials is by the contractor, and a processing arrangement where the ownership of raw material is by the principal (also, the share of IPP provided by the principal is often unknown). Some considered that recording the output of the FGP-contractor as a good would make more sense in the supply and use tables setting, however, whether a principal is a FGP or not seems irrelevant for the output of the contractor under both FGP and processing arrangements.

Figure 4: Views on the proposal that classification of FGPs should NOT depend on the affiliation with the contractor responsible for transforming the goods
