## Czechia

### Source

Data compiled by the Czech Statistical Office (CSO), Prague and provided to the OECD by Eurostat. The official estimates are published in 'National Accounts', CSO.

### General

From September 2014, these national accounts estimates are compiled according to the 2008 SNA ('System of National Accounts 2008', Commission of the European Communities-Eurostat, International Monetary Fund, Organisation for Economic Co-operation and Development, United Nations and World Bank, 2009).

Detailed methodology of the Czech national accounts could be found in Czech Statistical Office website: [http://apl.czso.cz/pll/rocenka/rocenka.avizo\\_revize?mylang=EN](http://apl.czso.cz/pll/rocenka/rocenka.avizo_revize?mylang=EN)

The financial intermediation services indirectly measured (FISIM) are allocated to industries and institutional sectors.

Original chain constant price estimates are referenced to 2015.

### Methodology:

#### Overview of GDP Compilation

GDP measures the final result of the productive activity of resident producer units without deductions for consumption of fixed capital.

Transactions compiled in quarterly frequency are the following:

All transactions in goods and services (at current, previous year's average, and 2010 constant prices), compensation of employees, taxes on products, taxes on production and imports, subsidies on products, subsidies on production, gross operating surplus and mixed income. For the general government and households sectors (only at current prices) – all transactions in goods and services, distributive transactions, transactions in financial instruments, and consumption of fixed capital.

Geographic coverage is the whole Czech economic territory.

Local versions of NACE Rev. 2 (activities) and CPA 2008 (products), as well as the COICOP (individual consumption by purpose), COFOG (functions of government), and CN (international merchandise trade) are utilized.

Reconciliation between various data sources on the most detailed possible level takes place. The expenditure approach is considered as more reliable, but statistical discrepancies are removed in balancing process by adjustments in the inventories category or in output and intermediate consumption.

The methodology of converting quarterly national accounts data from current prices into constant prices was harmonized with the procedure used in annual national accounts: the indicators are converted first into the previous year's average prices. Since 2004, as a rule, the indicators have been converted at first into the previous year's average prices and then chained into basic year prices (2010 year prices since October 2014) by means of annual average price indices. As a result of using this method of chain-linking (which is recommended by Eurostat) aggregates are not additive. It means that values of aggregates at 2010 prices do not agree with sums of individual components.

Base year is changed about every five years.

Regular seasonally adjusted data have been calculated with the help of the Tramo-Seats method (Demetra+1.0.2.), and published for GDP, individual components of the GDP expenditures and the gross value added by kind of activity since 2002 year. A correction for the influence of a different number of working days in individual periods has been performed since March 2005 on selected time series (for which this influence is statistically significant).

## **Expenditure Approach**

Primary source for household final consumption expenditure is the quarterly household budget survey that covers three thousand households. It concerns quota sampling without rotation of reporting households. The quarterly household budget survey has changed since January 2006. All types of households have been surveyed, including e. g. households of unemployed people, households of economically active pensioners. Food, beverages and free catering are surveyed in detail only in two of twelve months. This primary source (the quarterly household budget survey) has been recently combined with data on sales in trade, especially in retail trade. Government final consumption expenditure and capital formation are estimated from (complete) budget records kept by central government. Private gross fixed capital formation is largely based on the same sources as mentioned under the production approach, supplemented by foreign trade data, data on construction output, and other secondary sources. Changes in inventories are estimated by means of the same source as mentioned under production approach.

Data on imports and exports of goods are taken from foreign trade statistics but they have been a little adjusted since 2008 data; data on imports and exports of transport and other services have been taken from the CZSO's statistical surveys since the first quarter of 2007. The revisions have to be made to the previously published data from the period following the Czech Republic's accession to the European Union. Starting September 2011, the CZSO newly publishes in national accounts data on imports of goods and exports of goods in national concept which is strictly based on the change of ownership.

As with the production approach, the basic sources are adjusted for nonresponse. Then, grossing up is done for sample surveys.

Certain data on households' consumption and on gross fixed capital formation are estimated by extrapolating the annual estimates. In case of households expenditures it mainly concerns estimation of consumption of alcoholic beverages, cigarettes and imputed rents. Figures on gross fixed capital formation are estimated by using annual data figures for the sector of non-profit institutions and in the sector of non-financial enterprises for units with less than 20 employees. Adjustments are also made for financial leasing arrangements with the rest of the world.

## **Income Approach**

The data sources are the same as for the production approach.

In the Czech national accounts, the income approach to estimating GDP cannot be considered as an independent method because operating surplus and mixed income are not calculated separately. They are obtained in the form of balancing items between gross value added obtained by production approach and other components of gross value added (compensation of employees, taxes on production minus subsidies on production). The compilation and data sources of compensation of employees, taxes on production minus subsidies on production are similar to the compilation of components of GDP by production approach.

## **Production Approach**

Since 2007 the quarterly enterprise surveys have been split into two parts:

1. The first part (with the questionnaire named "P3-04") covers the following main indicators: labour indicators, flow indicators (selected components of revenues and cost) and increases and decreases of intangible and tangible fixed assets. Respondents are asked to send questionnaires up to 18 days after the end of the quarter. Reduction of required indicators enables a shortened processing time. The first results are available around 35 days after the

end of the quarter and hence they can be usable for GDP flash estimates compilation. There are four versions of the survey "P3-04" according to the facts if the respondents have been selected within the monthly surveys (SP 1-12, Stav 1-12 or Prům 1-12) or not and if they fill out "P6-04" questionnaire or not: version "b" and "d" for enterprises which do not fill out "P6-04" include three sections: labour indicators, flow indicators, and increases and decreases of intangible and tangible fixed assets. Version "d" for enterprises which have been selected within the monthly surveys contains fewer indicators in the first section. Version "a" and "c" for enterprises which fill out "P6-04" include only two sections: labour indicators and flow indicators. Version "c" for enterprises which have been selected within the monthly surveys contains fewer indicators in the first section. A census type survey is applied for enterprises with 100 and more employees. Sample survey is conducted for enterprises with 20-99 employees.

2. The second part (with the questionnaire named "P6-04") comprises stock financial indicators, which are necessary for compilation of quarterly financial accounts and increases and decreases of intangible and tangible fixed assets. Regular estimates of GDP take advantage of this part as well because stocks of inventories are included here. Only enterprises with significant amounts of assets have to fill in this questionnaire. Respondents send filled questionnaires up to 30 days after the end of the quarter (up to 35 days for 4th quarter). The survey "P6-04" is conducted as a census type. Approximately two thousand respondents fill in the questionnaire.

For the data on sales (or revenues, used for calculation of output) and purchases (or cost, used for calculation of intermediate consumption) from the quarterly enterprise surveys, corrections are made for non-response. Then, grossing up is done for sample surveys.

The data on sales (or revenues, used for calculation of output) and purchases (or cost, used for calculation of intermediate consumption) from the quarterly enterprise surveys are adjusted for holding gains/losses on inventories; subsequently the data are grossed up to economy-wide totals. The data for small enterprises not included in the quarterly enterprise survey and for the hidden economy are estimated by extrapolating annual accounts estimates by changes recorded for the medium sized surveyed enterprises. Letting of dwellings the services and owner-occupied housing are estimated in the same way as in annual national accounts by the same specialist (since 2000 – the user costs method for calculation of dwelling services in owner occupied dwellings). Household budget survey data are used for the estimate of own-account agricultural output. Priority is to reach comparability of output (at basic prices) and intermediate consumption (at purchasers' prices) with the same quarter in the previous year. This priority materializes in the estimation procedures in two ways: At first some quarterly figures are obtained by the same methods (e.g. exports, imports, final household consumption) and from the same data sources as annual ones. Methodology is the same. At second reconciliation between quarterly and annual figures is provided in this sense. The calculations are made in a breakdown according to the intermediate aggregation of NACE classification (that is, 44 categories).

## Democratic Republic of the Congo

### Source

Response to the United Nations national accounts questionnaire from the National Statistics Institute (Institut National de la Statistique - INS).

### General

The estimates shown in the following tables have been prepared in accordance with the concepts and definitions of the United Nations System of National Accounts 1993 (1993 SNA). Previously the estimates were prepared in accordance with the United Nations Systems of National Accounts 1968 (1968 SNA). Footnotes indicate when the scope and coverage of the data differ from the definitions and classifications recommended in the 1993 SNA.

### Methodology:

### Overview of GDP Compilation

Gross domestic product is estimated mainly through the production approach.

### Expenditure Approach

The expenditure approach is used to estimate government final consumption expenditure and exports and imports of goods and services. This approach, together with commodity flow approach, is used to estimate private consumption expenditure and gross capital formation. The estimates of government consumption expenditure are derived from the government accounts. Information on private consumption expenditure is obtained from household sample surveys on expenditure conducted by the Institut National de la Statistique in the principal urban centres. The results of these surveys are extrapolated to cover the whole country. Some items are calculated as residuals by using the commodity flow approach. For increase in stocks, information on the value of stocks at the beginning and end of the accounting year are obtained from the annual surveys of enterprises. For gross fixed capital formation, the estimates, using the commodity flow approach, are based on information on acquisition of capital goods obtained from the surveys of enterprises. The estimates of capital formation by the general government, public enterprises and public corporations are derived from accounts while information from external trade statistics are used for machinery and equipment. The estimates of exports and imports of goods and services are derived from the balance of payments.

### Income Approach

The "income" approach is based primarily on data from the Public Administrations and of the results of the survey 123. Income for formal companies is an estimate from the financial statements of the accounting business data subject to statistical and tax declarations (DSF), received by the Permanent Council of the Accounting Congo (PIC) for approximately 1,200 companies.

The year 2005 was chosen as the base year mainly because of the availability of this year's data base essential and it is not a year of great economic fluctuations.

<sup>a</sup> Refers to Wholesale and retail trade only.<sup>b</sup> Includes Education, Health, Social Work and other community services of private sectors.<sup>c</sup> Includes public education, health and social work.<sup>d</sup> The value of financial intermediation services indirectly measured (FISIM) is deducted from gross value added.

## Denmark

### Source

Response to the National Accounts Questionnaire from the Statistics Denmark, Copenhagen. The official estimates are published in 'Nationalregnskabstatistik', Danmarks Statistik.

Detailed methodology of the Danish national accounts could be found in Statistics Denmark website: <http://www.dst.dk/en/Statistik/dokumentation/hovedrevideret-nationalregnskab/hovedeffekter-af-revisionen.aspx>

The data provided to UNSD is received through the Organisation for Economic Cooperation and Development (OECD), Paris.

### General

From September 2014, these national accounts estimates are compiled according to the 2008 SNA ('System of National Accounts 2008', Commission of the European Communities-Eurostat, International Monetary Fund, Organisation for Economic Co-operation and Development, United Nations and World Bank, 2009).

The financial intermediation services indirectly measured (FISIM) are allocated to industries and institutional sectors.

Original chain constant price estimates are referenced to 2010.

### Methodology:

#### Overview of GDP Compilation

Definition: GDP measures the value generated by all resident units engaged in productive activity before deduction of provisions for the consumption of fixed capital.

Account coverage: In the quarterly account GDP from the production and expenditure approach is compiled. Independent estimates of GDP from the income side are not made. However, an income breakdown of GDP is compiled with operating surplus as a residual. Quarterly institutional sector accounts including financial accounts are available for General Government only.

No estimation is made for illegal activities. Hidden economy is part of the quarterly accounts and covers underreporting in e.g. retail sales, restaurants, construction, repair and maintenance of motor vehicles and personal services. In general the level of underreporting established in the annual national accounts is extrapolated on the basis of developments in the corresponding recorded activity.

#### Expenditure Approach

The most important sources for the estimate of the components of expenditure-based GDP are the following:

Household final consumption expenditure:

Retail trade statistics, DOI (level of retailable consumption)

The FU [household budget survey] (structure of retailable consumption, services)

VAT statistics

Surveys of housing rentals

Housing surveys (housing stock, stratified)

Energy statistics (electricity, gas, district heating)

Statistics on financial institutions (financial services)

Statistics on public finances (user payments to public institutions)

Tax statistics (quantities of goods on which excise duties are levied)

## Supply side estimates

Motor vehicle statistics (households' acquisitions of new cars)

Balance of payments statistics (tourist revenue and expenditure)

## Final consumption expenditure in NPISHs:

ERE [establishment-related employment statistics] estimates of total wages and salaries

## Gross fixed capital formation:

Agricultural statistics

Public finance statistics

Accounts statistics for industries predominated by public corporations

Register of buildings and dwellings (BBR)

Index of construction costs

Product statistics for the IT industries

ICT expenditure

External trade statistics

Industrial accounts statistics

Specific industry statistics

Media statistics

Register of motor vehicles

Register of vessels

Register of aircrafts

## Acquisitions less disposals of valuables:

Industrial commodity statistics

External trade statistics

Household budget survey (FU)

## Changes in inventories:

Industrial accounts statistics

SLS-E statistics

Accounting statistics for industries where public corporations predominate

Specific industry statistics, including agricultural statistics

Energy statistics

Agricultural statistics

## Imports and exports of goods and services:

External trade statistics (Intrastat and Extrastat)

Balance of payments statistics

Settlements statistics from the Nationalbank

VAT statistics

Accounts statistics for sea water transport.

By far the largest share of expenditure-based GDP is calculated using a direct estimate. The most important exceptions are household consumption of hotel and restaurant services, dwelling services, consumption in NPISH, which are all calculated indirectly from the supply side.

For some consumption groups of household final consumption expenditure, more than one source is available. In these cases, an assessment of which source is the most reliable for estimating the variable (consumption group) has been made. The assessment mainly relates to whether the consumer survey (FU) should be replaced by another source.

The main rule in the Danish national accounts has been that wherever possible the FU has been replaced by other information to determine levels, but it is widely used to determine the structure of expenditure – for the breakdown

of food consumption into individual foodstuffs, for example. For retailable consumption, i.e. that share of private final consumption which passes through retail trade, the FU figures are replaced by retail sales figures which must be considered a much better statistical source for determining levels of private consumption. The FU figures are used to divide the aggregate groups from retail sales statistics into the detailed consumption groups. For energy products and acquisitions of motor vehicles, there is special information available based on physical data.

Capital formation can in principle be estimated in two ways, either directly using information on the expenditure (uses) side (purchaser's side) or indirectly on the basis of supplies of products to the domestic market, using estimated shares of supplies to the final demand components to calculate final uses from the resources side. During the recent years widening of the scope of the industrial accounts statistics have led to estimates of GFCF in machinery, equipment and major building repairs that have gradually changed from supply side estimates to estimates that are mainly based on information from the uses side. The estimates for construction of new buildings are based either on accounting statistics with very detailed coverage of actual observations or a calculation based on the exhaustive register of buildings (the BBR) and prices pr square meter for the different types of buildings. However, even after the introduction of a direct expenditure based estimate of capital formation in machinery and equipment, it is likely that it will be adjusted to some degree to take account of supply side estimate

Since the Danish national accounts are adjusted in a detailed product balance system, there is a systematic confrontation in connection with the balancing. One of the strongest cross-checks for the compilation of national accounts consists in comparing information from purchasers on their acquisitions less disposals of the individual products or groups of products with information on the sellers' side on supplies to the domestic market.

Transition from private accounting and administrative concepts to NA concepts:

In household and business accounts, purchases of goods and services are recorded in terms of purchasers' prices including non-refundable VAT. Refundable VAT is not included in the acquisition prices, on which information is available, which is consistent with the ESA 1995 net VAT system.

Various acquisitions which the national accounts treat as gross fixed capital formation are included in business accounts as current operating expenditure in the form of intermediate consumption or wages and salaries which are not capitalised. Examples would be consumables as well as purchased and own-produced software. The corrections on the expenditure side are a mirror image of the corrections to the output value (e.g. own-produced software) and intermediate consumption (consumables and purchased software) in the output-based estimate as described in chapter 1.3 and chapter 3.

For each type of inventory, changes in inventories in the business accounts are calculated as the value of closing stocks minus the value of opening stocks, estimated according to the enterprises' own accounting principles, which means that opening and closing stocks are calculated at different price levels. In the national accounts, changes in inventories should be estimated at the average prices for the year. Ideally, changes in inventories should be monitored throughout the year and all changes split into revaluations (holding gains) and national accounts changes in inventories. Normally, a reasonable approximation of the correct change can be produced by converting the value of both opening and closing stocks to the average prices for the year using the ratio of the year's average price to the price on the date of the inventory estimate. In the Danish national accounts, opening and closing stocks are converted to average prices for the year for all combinations of product number/target total module code/DK-NACE industry/sector following the breakdown of inventory totals by product. The national accounts change in inventories is calculated as closing stocks minus opening stocks for each of these combinations.

For import and export of services, the statistical challenge arising from the use of settlements statistics for the estimate of aggregate exports/imports of services lies in ensuring that the definition of what constitutes an export or an import of services remains consistent with the external trade statistics and national accounts estimates of exports of goods f.o.b. and imports of goods c.i.f. Therefore, a correction is made to exports and imports of services as estimated in the settlements statistics to bring the latter into line with the estimate of exports of goods f.o.b. and imports of goods c.i.f.

Constant price estimates are derived by deflation of each of the 2,350 product balances in the SUT. For each product separate deflators are used for domestic output, imports, exports and domestic uses. In particular consistency with the consumer price index is ensured at a detailed level.

## Income Approach

The main sources used for compiling GDP from the income side are:

- The annual working time accounts (WTA) (compensation of employees)
- The system for compiling fixed capital in the national accounts (consumption of fixed capital)
- Administrative data used for compiling general government (other taxes on production and imports and other subsidies on production)
- Gross operating surplus and mixed income are compiled as residuals.

The WTA is compiled in Statistics Denmark's division for labour market statistics. The WTA is used almost directly in the national accounts and only with a few adjustments made in the national accounts. The background for the WTA is a considerable expansion in the number of statistics covering the labour market and the fact that the figures from different statistics are not immediately comparable. The WTA is a statistical system integrating already existing labour market statistics.

## Production Approach

General Government:

For central government, the main statistical source is central government accounts. For local government, the main source is local government accounts for all 275 municipalities and 14 counties. For the "self-owning" institutions, under both central and local government, annual accounts, assumed to cover the whole population, are collected. For the social security funds, the statistical source is their annual accounts, which are collected for all units concerned.

The units included in the statistical system for public finance as producer units in S.13 and those units which are classified in the business register as government non-market units are exactly the same. The grouping of government units by purpose, COFOG, is only added in the public finance statistical system and not in the business register.

The accounting plan in central government accounts is not the same as that used for local government accounts. All municipalities and counties are obliged to use the local government plan. When compiling national accounts, the accounts for central government, local government, "self-owning" institutions and social security funds are coded with national accounts classifications based on ESA95. Then they are stored in one compilation system, the DIOR database [Databasen for integrerede offentlige regnskaber, i.e. database for integrated public accounts]. All individual entries at the most detailed level of the primary accounting systems are given an ESA95 code. All entries are classified by type of transaction, by purpose and by industry.

Financial institutions:

The sectoral delimitation of the subsectors complies strictly with the ESA 95 rules. Subsectors S.121 The central bank and S.122 Other monetary financial institutions have complete accounts.

In subsectors S.123 Other financial intermediaries and S.124 Financial auxiliaries, certain units are not covered by the financial accounts statistics collected by the supervisory authority, Finanstilsynet, or by Statistics Denmark. For S.123, those accounts which are available for the sector are grossed up to cover all units in that sector on the basis of employment. Enterprises in S.124 are covered by company accounts also grossed up on the basis of employment to cover the total population.

Insurance corporations and pension funds are covered in full by Finanstilsynet's accounting estimates.

#### Non-financial corporations:

For publicly controlled non-financial corporations the source for the national accounts estimate is "statistics for public enterprises". As general government statistics are compiled in line with national accounts principles, the extended statistics for public enterprises are processed according to national accounts definitions and presented according to the accounting plan for non-financial corporations in the ESA 95. One of the reasons is the desire to be able to produce a national accounts estimate of the "public sector", which is a combination of general government (S.13) and public corporations (S.11001). The public sector is all producer units in the economy under public control.

Non-financial corporations other than the government controlled and the household sector (sole proprietorships and households as owner-occupiers) together account for by far the largest share of market output in the economy. As a general rule, value added is calculated from the two sets of accounts statistics, namely:

- a) the industrial accounts statistics, which is by far the most important, covering for 2003 all non-financial producer units other than general government and industries where public corporations traditionally predominate and
- b) "SLS-E accounts statistics", which cover the remainder of the economy, mainly certain personal service industries. This is accounts statistics based on standardised accounts (SLS-E=Statens Ligningssystem for Erhvervsdrivende), the government tax assessment system for businesses), which all firms, with certain exceptions, have to send in to the tax authorities together with their tax returns.

The SLS-E statistics is used for the grossing up of the industrial accounts statistics as well as for compiling the industries mentioned under b) which are not covered by industrial accounts statistics.

#### Agriculture, horticulture and the raising of fur animals:

The statistical source for agriculture, horticulture and the raising of fur animals is Danmarks Statistik's agricultural statistics which, as already stated, are a national accounts estimate. The statistics comply with the guidelines in Eurostat's agricultural statistics manual. The calculations of intermediate consumption are based on 1) quantities of products used multiplied by the average selling price, 2) accounting information collected by the economic advisers for agriculture and 3) annual accounting statistics for agriculture and horticulture compiled by Statens Jordbrugs- og Fiskerøkonomiske Institut.

#### Dwellings:

The output value of dwellings is estimated every fourth year as a benchmark calculation of the price times volume type, based on the total stratified housing stock and comprehensive rental figures covering almost two-thirds of all dwellings in Denmark which are let. Both sources must be considered to be of high quality.

In years between the benchmark calculations, the latest benchmark is projected using price and volume indicators. The price indicator is rental information from the sample survey of rentals which is carried out every six months to provide information on changes in rentals in the consumer price index. The volume indicator is information from building statistics based on Bygnings- og Boligregistret (BBR) [the Register of buildings and dwellings] which gives the number of square metres constructed combined with an estimate of the number of dwellings demolished.

The benchmark calculation is particularly detailed and uses the stratification method which the GNP Committee approved as the preferred method. The stratification of the housing stock is much more detailed than the minimum requirements set out in the Commission Decision (95/309/EC, Euratom). Whilst this Decision requires a minimum of 30 strata, the Danish calculation of levels for 1999 uses roughly a thousand strata.

#### Non-profit institutions serving households:

By far the largest expenditure component in the case of private non-market output is the wage or salary bill. In Denmark, the ERE (Erhvervsbeskæftigelsesstatistik, translated into English in Danmarks Statistik publications as "Establishment-related employment statistics") statistics calculate the total wage or salary bill in all producer units in the economy, including in private non-profit institutions serving households. This is the main source for the calculation.

For want of accounting statistics in this field, the other components in the estimate of output from the costs side, i.e. intermediate consumption, consumption of fixed capital and other taxes and subsidies on production, are calculated on the basis of the accounts for the largest trade union (HK).

Private households with employed persons:

Statistics Denmark has carried out two benchmark surveys linked to the labour force surveys for 1992 and 2004, in which the households were asked a series of questions on their untaxed activities. Interviewees were asked about the number of hours worked and their income. On the basis of these figures, benchmark values were fixed for output by grossing up to the total population.

From 1992 and onward values were projected in the current years using changes in the net price index (consumer price index excluding taxes on products and subsidies) for cleaning. And off course, the new benchmark value in 2004 gave an opportunity to make a minor revision of the figures in the years between the two benchmarks.

Transition from private accounting and administrative concepts to ESA95 concepts:

After processing the accounting statistics underlying the national accounts calculations of value added a number of corrections to the first version are carried out. These corrections include:

On the supply side:

- 1) Production in the hidden economy
- 2) Fringe benefits produced from own production
- 3) Revenue from licenses and royalties
- 4) Software produced on own-account
- 5) Entertainment, literary and artistic originals
- 6) Price correction of changes in inventories of finished goods, work in progress and goods for resale.

On the uses side:

- 7) Fringe benefits purchased
- 8) Financial intermediation services paid for directly
- 9) FISIM
- 10) Correction for net insurance premiums
- 11) Public fees
- 12) Expenditure on licences and royalties
- 13) Software produced on own-account
- 14) Purchased software
- 15) Price correction of changes in inventories of raw materials
- 16) Small tools etc.

<sup>a</sup> Statistical discrepancy between net lending (+)/net borrowing (-) in the financial account and net lending (+)/net borrowing (-) in the capital account.

# Djibouti

## Source

Response to the United Nations national accounts questionnaire from Direction Nationale de la Statistique, Djibouti.

## General

The estimates shown in the following tables have been prepared in accordance with the United Nations System of National Accounts 1993 (1993 SNA) so far as the existing data would permit. When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in the SNA, a footnote provides explanation.

### Source

Response to the United Nations national accounts questionnaire from the Ministry of Finance, Trade and Industry, Roseau.

### General

The estimates shown in the following tables have been prepared in accordance with the United Nations System of National Accounts 1993 (1993 SNA) so far as the existing data would permit. When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in the SNA, a footnote provides explanation.

## Dominican Republic

### Source

Response to the United Nations National Accounts Questionnaire from the Banco Central de la Republica Dominicana, Santo Domingo. The official estimates of the national accounts of the Dominican Republic are published by the Central Bank on its web page, in the series Cuentas Nacionales de la República Dominicana, Año de Referencia 2007, which also includes a detailed description of the sources and methods used for the national accounts estimates.

### General

The most recent estimates contained in the following tables have been prepared in accordance with the concepts and definitions in the System of National Accounts 2008 (2008 SNA), based on responses to a conceptual questionnaire and/or other available information. The national accounts of the Dominican Republic have classifications of products, economic activities, institutional sectors and economic transactions following the 2008 SNA and other international classifications.

### Methodology:

### Overview of GDP Compilation

Gross domestic product is estimated mainly through the production approach, while taking into account expenditure and income approaches.

### Expenditure Approach

The main sources for estimates at current prices and chain-linked volume indices with 2007 as the reference year are as follows: for public consumption, records relating to non-market public administration activities, education and health, and the consumer price index (CPI). Private consumption is estimated using a synthetic indicator, which takes account the majority of the goods and services that have a proclivity of consumption (more than 80% of the basket of goods and services). Gross fixed capital formation involves measuring construction activities, along with total imports of machinery and equipment. Additionally, data of imports and exports of goods and services data is derived from the Balance of Payments in dollars, provided by the International Department of the Central Bank. Imports and exports estimations are based on registries from the customs office. Finally, changes in stocks estimated as a residual variable.

### Income Approach

Compensation of employees comprises all payments of wages and salaries by resident producers to workers in cash and in kind, together with disbursements for social security, private pension funds, family allowances, life insurance and similar schemes of benefit to workers.

The data on indirect taxes and subsidies are based on the annual reports of the Ministry of Finance and information from the Treasury and National Budget Office.

The operating surplus is estimated as the difference between the value added by resident producers and the sum of the cost of employees' remuneration and taxes on production net of subsidies. Earnings and profits by companies are assumed on the basis of their participation in productive activities.

### Production Approach

Estimates of GDP, by industry, are estimated from a spread of 35 activities, using the International Standard Industrial Classification of all Economic Activities (ISIC Rev. 4), as adapted to the Dominican Republic economy, as a reference framework. Classification by products is based on a spread of 175 products, in accordance with the Central Product Classification (CPC Rev. 2).

GDP estimate by the production approach is performed on an annual and quarterly basis, the latter being benchmarked to the annual values using the Proportional Denton method for current terms and for the chain-linked volume indices. This process is held for the economic activities.

Annual and monthly information on Agriculture is provided by the Ministry of Agriculture and its dependencies. It contains volume and prices data, as well as operational costs and work-in-progress by product.

Information on Non-financial institutions is gathered in financial statements provided by representative units according to its economic activity. Direct communication is performed between these units and the technicians of the National Accounts Department; therefore timely information is received for annual, quarterly and monthly estimates of volume and prices.

Government data is opportunely received comprising all income and expenditure operations performed by this sector.

Financial data is available through online banking system, with detailed information on income, operational costs, assets and liabilities.

Households information is collected through the National Labor Force Survey, carried out on April and October by the Central Bank. For detailed and structured data a Households Income and Expenditure Survey was completed for 2007. Volume and prices indicators are grouped for final consumption quarterly estimates.

Goods and services exports and imports statistics are received on a monthly basis, allowing the classification of the latter by economic uses.

There is no discrepancy shown among production and expenditure approaches, since changes in inventories is the residual variable for quarterly data, considering the production estimation the most reliable approach. Quarterly GDP series, production and expenditure approaches, and in current terms and chain-linked volume indices with 2007 as the reference year, are published from 2007 onwards. Additionally, a Monthly Economic Activity Index (IMAE in Spanish) is benchmarked to the quarterly GDP series.

## Ecuador

### Source

Response to the United Nations national accounts questionnaire from the Subproceso de Cuentas Nacionales, Banco Central del Ecuador, Quito. The official estimates are published annually in "Cuentas Nacionales" Bulletins.

### General

The latest estimates shown in the following tables are considered to be prepared in accordance with the concepts and definitions of the System of National Accounts 2008 (2008 SNA), based on the response to a conceptual questionnaire and/or other available information. Previous estimates were prepared in accordance with the United Nations System of National Accounts 1993 (1993 SNA) and in US dollar.

Effective March 13, 2000, a full dollarization scheme was established (ley para la Transformacion Economica del Ecuador). The currency of Ecuador is the Ecuadorian Sucre, but the dollarization legislation allows the free circulation of the dollar and provides for a limited issue of domestic coins with small value to remain in circulation to facilitate small transactions and requires that they be fully backed at all times by dollars. The dollarization legislation provides for the central bank to exchange on demand sucres at a rate of Sucre 25000 per US \$1.00.

The Central Bank of Ecuador undertook the work to change the base year at 2007, and also prepared information consistent with this new base year, for the most important macroeconomic aggregates, from 1965 to 2006. These data are denominated in millions of dollars (base year = 2007). When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in the SNA, a footnote provides explanation.

<sup>c</sup> Item does not consider consumption of fixed capital.

## Egypt

### Source

The preparation of national accounts statistics in Egypt is undertaken by the Ministry of Planning, Cairo. Official estimates are published in the annual "Statistical Yearbook" published by the same agency. The following tables have been prepared from successive replies to the United Nations national accounts questionnaire. Some tables have been updated from 1987 onwards using the "Economic Bulletin", Vol. 52 No. 1, 1999 of the National Bank of Egypt. The data from 1996 onwards have been prepared from successive replies to the United Nations national accounts questionnaire.

### General

The estimates are generally in accordance with the classifications and definitions recommended in the United Nations System of National Accounts 1993 (1993 SNA). When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables.

### Methodology:

### Overview of GDP Compilation

Gross domestic product is estimated mainly through the production approach.

### Expenditure Approach

All components of gross domestic product by expenditure type are estimated through the expenditure approach. The estimates of government final consumption expenditure are based on government budgets and accounts. For private consumption expenditures, the estimates are based on family budgets and household expenditure surveys. The Department of Statistics prepares data on inventories of cotton, covering both commercial stocks and stocks of spinning industry. Other sources of information for changes in stocks include data collected regularly by the Ministry of Supply. For gross fixed capital formation, the government sector is estimated directly together with government consumption expenditure. The private sector estimate is obtained by deducting the government estimate from total capital formation. Capital formation in machinery and equipment is estimated through the commodity-flow approach using information on domestic production, imports and exports of capital goods. The estimates of exports and imports of merchandise are generally based on foreign trade statistics. The estimates of GDP by expenditure type in constant prices are prepared by the CAPMAS on the basis of official index numbers of prices and quantities.

### Income Approach

The estimates of wages and salaries are based on government accounts and on various sectoral surveys. No specific information is available for operating surplus, which is computed as a gross estimate, i.e., including consumption of fixed capital. Indirect taxes and subsidies are separately available for all economic units in the compulsory standard accounts for public enterprises and in the economic surveys for the private sector.

### Production Approach

The table of gross domestic product by kind of economic activity is prepared in factor values. The production approach is used to estimate value added of most industries. The income approach is used to estimate value added of community, social and personal services. The Ministry of Agriculture collects, through annual sample surveys, data on crop area, yield and crop-cutting. Livestock data are obtained through special censuses every two years and prices received by farmers are collected annually. The estimated acreage of each of the main crops is multiplied by average productivity of the basic area of measurement. The gross output is evaluated at farm-gate prices and estimates of intermediate consumption are based on data collected from the co-operative societies and from censuses. For the industrial activity sector, annual statistics on industrial production, capital formation,

employment, wages and salaries are available for industrial establishments with ten workers or more which form the organized sector of the economy. For the non-organized sector, estimates are made by using data from industrial censuses and by studying the cost-structure of each industry, productivity and degree of mechanization.

The output of construction is estimated indirectly from the input side by means of employment data and data on intermediate consumption. The value of gross output and components of value added are obtained by using the relationship between available data on intermediate consumption and primary inputs in organized enterprises and applying this relationship on the estimated intermediate consumption of this industry. For trade, annual basic statistics are available for establishments with five or more workers, while those with less than five workers are covered by sample surveys conducted every three years. Estimates for restaurants are made by using data on establishments, wages and salaries, working hours and data from sample surveys. Estimates for hotels are obtained through annual questionnaires. Data on input, output and other elements of large-scale transport are available through annual accounts. For unorganized transport, estimates are based on information on the number of establishments and workers, on wages and salaries and on other sources. Indicators such as input ratios are used to estimate value added.

Gross output and input of public financial institutions and insurance companies are based on data collected annually. The estimates of real estate, business services, and imputed rents of owner-occupied dwellings are based on family budget surveys. The government accounts provide information to estimate government services. Annual data are available for non-profit institutions serving households. For the service activities of unincorporated enterprises, gross output and inputs are estimated by using available censuses of establishments, wages and salaries statistics. The constant prices of GDP by kind of economic activity are estimated by CAPMAS on the basis of official index numbers of prices and quantities such as wholesale prices, consumer prices and quantities of imported and exported merchandise.

## El Salvador

### Source

The preparation of national accounts statistics in El Salvador is undertaken by the Departamento de Cuentas Macroeconómicas, Gerencia de Estudios y Estadísticas Económicas del Banco Central de Reserva de El Salvador. The official estimates are published quarterly in "Revista Trimestral" and monthly on the internet ([www.bcr.gob.sv](http://www.bcr.gob.sv)). A detailed description of the sources and methods used for the national accounts estimation is contained in "Cuentas Nacionales de El Salvador, base 2005. Serie homogénea 1990-2005" published by the Banco Central de Reserva de El Salvador in 2017.

### General

The estimates shown in the following tables have been prepared in accordance with the United Nations System of National Accounts 2008 (2008 SNA). The following tables have been prepared from successive replies to the United Nations national accounts questionnaire. When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in the SNA, a footnote provides clarification.

### Methodology:

### Overview of GDP Compilation

The new reference framework of the National Accounts, base 2005, which incorporates the methodological recommendations of the 2008 SNA.

The estimation of the historical series was made for both the GDP by the production approach and aggregate demand approach, in current values and in terms of volume, with annual and quarterly periodicities.

### Expenditure Approach

The estimates by the expenditure approach are obtained from the supply of eighty products setting the production's destinations as the households final consumption, investment and exports; and for the government, the production has only one destination: the public consumption. The estimates of government consumption expenditure are obtained directly from government sources. The estimates of increase in stocks are based on information on stored agricultural products, and the stocks of the manufacturing and trade. Private capital formation is estimated on the basis of data on domestically produced and imported capital goods and on statistics of construction and repair work. The imports data are adjusted to include import duties, trade margins and installation costs. For public expenditure on capital formation, data are obtained from official sources. Data on exports and imports of goods and services are obtained from the balance of payments. Export data on coffee are obtained from the Consejo Salvadoreño del Café. Gross domestic product by expenditure at constant prices is estimated.

# Equatorial Guinea

## Source

Response to the United Nations national accounts questionnaire from Le Ministère de l'Économie, de la Planification et des Investissements Publics, l'Institut National de la Statistique de Guinée Equatoriale (INEGE), Malabo. The official estimates and information on concepts, sources and methods of estimation can be found in "Les comptes Nationaux de Guinée Équatoriale, 2006 - 2013. website [www.inege.gq](http://www.inege.gq)

## General

The estimates shown in the following tables have been prepared in accordance with the United Nations System of National Accounts 1993 (1993 SNA). When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in the SNA, a footnote provides explanation. On 2 January 1985, the Ekwele was replaced by the CFA franc. Four bipkwele are equivalent to 1 CFA franc.

The current base year is 2006. 2006 was chosen as base year because it was the year of completion of the first survey among Equatoguinean Households (EEM), which measures the final consumption expenditure of households.

## Estonia

### Source

Data compiled by Statistics Estonia, Tallinn and provided to the OECD by Eurostat.

From September 2014, these national accounts estimates are compiled according to the 2008 SNA ('System of National Accounts 2008', Commission of the European Communities-Eurostat, International Monetary Fund, Organisation for Economic Co-operation and Development, United Nations and World Bank, 2009).

Detailed methodology of Estonian national accounts could be found in Statistics Estonia website: <http://www.stat.ee/79711> 'Estonian national accounts methodology'.

The financial intermediation services indirectly measured (FISIM) are allocated to industries and institutional sectors.

Original chain constant price estimates are referenced to 2015.

On January 1, 2011, Estonia adopted the Euro as its national currency. Data related to years prior to entry into EMU have been converted using the irrevocable Euro conversion rate (15.6466).

### General

Statistics Estonia compiles national accounts, including QNA, according to the concepts, definitions, classifications and accounting rules of the European System of Accounts (ESA 2010). GDP is compiled by three approaches: production approach, expenditure approach and income approach. Income approach largely uses the same sources as production approach. The GDP by income approach is not an independent approach, as some components, such as operating surplus and mixed income, are derived residually. Transactions in goods and services are calculated on an accrual basis.

The production approach is the main method for compiling GDP in Estonia. In GDP compilation, the production approach is considered to be the most reliable method, because of more detailed information is available for this approach, and there are more possibilities to verify the estimates against alternative data sources.

### Methodology:

#### Expenditure Approach

Expenditure approach is an independent approach as the various expenditure components are completely estimated.

GDP at market prices by expenditure approach is derived as the sum of the components of household final consumption expenditure, final consumption expenditure of government and final consumption expenditure of NPISH, gross fixed capital formation and valuables, changes in inventories, net exports of goods and services.

Household final consumption expenditure is valued at purchasers' prices. Acquisitions of fixed assets are valued at purchasers' prices. Exports and imports of goods and services are recorded at f.o.b. value. Changes in stocks are valued at current average prices of the accounting period. In national accounts, changes in inventories are valued at basic prices for stocks of finished goods and work-in-progress and at purchasers' prices for inventories of materials and supplies and goods for resale. Two kinds of adjustments are made for the inventories data provided by source statistics: first, for the inventories of finished goods and work-in-progress, mark-up adjustment for operating surplus is made to arrive at basic prices; secondly, holding gains are eliminated from changes in inventories of finished goods, work-in-progress, inventories of materials and goods for resale.

Indirect estimation methods are derived from the national accounts estimates on production of agricultural, fuel

wood and fishing products for own final use by households, actual rentals of dwelling services and purchasing of the motorcars by household. The calculations of gross fixed capital formation of new dwellings in the households sector are also based on the indirect estimation model. Dwelling services are valued according to the user cost method.

## Income Approach

Income approach uses to a large extent the same data sources as production approach. This means that the two approaches coincide with respect to use of the surveys and administrative sources involved. The GDP by income approach is not an independent approach as some components like operating surplus and mixed income are derived residually.

Income approach distinguishes between the following components: compensation of employees, consumption of fixed capital, other taxes on production and imports, other subsidies on production, operating surplus and mixed income.

Most of the basic data available for the compensation of employees and other taxes and subsidies on production are directly measured. However, gross operating surplus, including mixed income, is calculated indirectly as the residual between GDP estimated via the production approach and the remaining components of the income approach. Consumption of fixed capital is based on the indirect estimation model.

## Production Approach

Production approach is considered to be the most reliable one in the GDP compilation, due to the availability of more detailed information and a better possibility to compare estimates obtained from many alternative data sources.

Statistics Estonia follows the institutional sector division in respect of the data compilation for the production and income approach. Five institutional sectors are distinguished:

- \* non-financial corporations (S.11)
- \* financial corporations (S.12)
- \* general government (S.13)
- \* households (S.14) and
- \* non-profit institutions serving households (NPISH) (S.15).

Each sector is broken down into activities or into activities and sub-sectors. The breakdown by institutional sectors is used for estimates of value added (incl. output and intermediate consumption), gross capital formation, exhaustiveness and sector accounts.

Transactions in goods and services are calculated on an accrual basis. Transactions in goods and services have different price references for their recording. Output is valued at basic prices in the cases of market production and production for own final use, while intermediate consumption is valued at purchasers' prices. In national accounts, the valuation of taxes is on accrual (time-adjusted cash method) basis.

Since non-market output has no prices, it is valued at the total production costs. According to the ESA 2010 methodology, the whole output value of general government is estimated as the sum of intermediate consumption, compensation of employees, consumption of fixed capital and other taxes on production. There are no other subsidies on production for government non-market producers. As non-profit institutions serving households are also non-market producers, the output calculations are made on the basis of costs.

At present, direct estimation methods dominate in the production approach. However, most of the exhaustiveness adjustments are not based on direct observations, and should therefore be considered as indirect methods.

## Overview of the Compilation of the Integrated Economic Accounts

Methodology of ESA 2010 is followed and the same sources of information are used as in compilation of GDP. There is no direct source of information for assets and liabilities for S14 and S15 in financial account therefore the sectors are treated as a residual. No total adjustment between non-financial and financial accounts is made and two different values are reported for net lending/net borrowing.

## Eswatini

### Source

National Accounts are compiled by the National Accounts Unit in the Central Statistical Office (CSO) at the Ministry of Economic Planning and Development (MEPD). Official estimates are published annually by the CSO in the "National Accounts Report" and in other official publications.

### General

The CSO has re-benchmarked the GDP 2011 estimates to the new base year (2011) for both the production and expenditure approaches. The CSO uses the calendar year for the national accounts compilation. Prior to this rebasing, the former base year used was 1985. The main data source for the updating of the benchmark year was the 2011 Economic Census. The GDP time series for the period 2000 to 2010 were rebased according to the 2011 base year for GDP by economic activity and expenditure. The rebasing was completed both in current prices and in volume terms.

The International Monetary Fund (IMF) through the Regional Technical Assistance Center (RTAC) in Southern Africa (AFRITAC South - AFS) supported the national accounts unit in the re-benchmarking and rebasing exercise during several missions. These technical missions helped the national accounts unit to refine the methodology used to prepare the accounts and improve the quality of the data.

The national aggregates in constant prices are reported in the form of volume measures with a fixed base year (2011).

The CSO released the National Accounts Report 2015 in April 2016 which provided 2011 Benchmark Estimates, including independent estimates for GDP by economic activity and expenditure, GDP by institutional sectors and GDP income components as well as rebased GDP Estimates 2000 to 2011. Following this, the CSO has incorporated the guidelines recommended by the System of National Accounts 2008 (2008 SNA) and compiled estimates according to definitions where possible. GDP estimates from 2011 now reflect the adoption of administrative data as a main data source and further improvements to the methodology.

### Methodology:

#### Overview of GDP Compilation

GDP is calculated using the production and expenditure approach. The official GDP data are based on the production approach, such that a statistical discrepancy is included on the expenditure side.

In the production approach, gross value added of all economic activity is at basic prices and excludes FISIM. GDP at purchaser's prices is equal to the sum of gross value added, less FISIM, plus taxes on products (SNA Classifications of Transactions, D21).

The classification of individual economic activities is based on the International Standard Industrial Classification ISIC Rev. 4.

#### Expenditure Approach

Estimates for final expenditure at current and volume terms at 2011 prices are produced for the final expenditure GDP components, excluding changes in inventories.

Final consumption expenditure by households was previously derived as a residual using GDP estimates from the production approach. For the benchmark and rebasing exercise, results from the 2010/11 Swaziland Household Income and Expenditure Survey (SHIES) is used to estimate consumption and the Classification of Individual Consumption according to Purpose (COICOP) classification is used.

Government final consumption expenditures are compiled from government expenditure data from the Ministry of Finance (MoF) and are produced using the Classification of the Functions of Government (COFOG).

Due to limited information, the estimated non-market output from the production accounts was used as final consumption expenditures of NPISH and detailed estimates by purpose of NPISH - Classification of the Purposes of NPISH (COPNI) were not compiled.

Gross capital formation is measured as gross fixed capital formation, estimated from annual surveys and government expenditure. Changes in inventories are not taken into account.

Data on imports and exports are derived from Balance of Payments (BoP) data provided by the Central Bank.

Constant price estimates are derived from the nominal estimates and deflated with suitable price indices, including the Consumer Price Index (CPI) of the country and the South African producer price index from Statistics South Africa. The reason for the extensive use of price indices from South Africa was that besides the CPI, price information was scarce in Swaziland.

## Production Approach

Data is obtained from various sources including administrative data and annual surveys.

Estimates for output, intermediate consumption and gross value added are estimated by type of economic activity in accordance with the International Standard Industrial Classification (ISIC Rev. 4) at class level and then aggregated to section level. Estimates of economic activity include both formal and informal activities, with informal activities for specific sections being estimated from statistical surveys and demographic sources, e.g. the Labour Force Survey (LFS).

The constant estimates with the fixed base year 2011 are derived from the nominal estimates and deflated with suitable price indices, including the Consumer Price Index (CPI) of the country and the South African producer price index from Statistics South Africa.

## Ethiopia

### Source

The preparation of national accounts statistics in Ethiopia is undertaken by the National Accounts Directorate of Ministry of Finance & Economic Development, Addis Ababa. The official estimates are published annually in the "National Accounts Statistics of Ethiopia". The methodological notes are prepared and entitled "National Accounts Statistics of Ethiopia: Sources and Methods". The recent series of the NAS is posted and available online from the website. (<http://www.mofed.gov.et/>)

### General

The estimates are generally in accordance with the classifications and definitions recommended in the United Nations Systems of National Accounts 1993 (1993 SNA). The Ethiopian fiscal year (EFY) which ends 7 July has been used for all estimates except for the Rest of the World Accounts. The release calendar of annual estimates is 3-4 months after the end of the fiscal year (i.e. October and November). The national accounts aggregates in constant prices are reported in the form of volume measures with a fixed base year which currently the year 2015/2016 (2008 EFY). A two-years-back revision policy is in practice to revise preliminary estimates where actual administrative and survey reports show delays during compilation time. While filling this questionnaire, where the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables.

### Methodology:

#### Overview of GDP Compilation

Currently, GDP is compiled using two approaches: production and expenditure where the production approach or the supply side compilation method. The income approach GDP is not compiled. Production-based GDP is calculated at market prices as the sum of the gross value added generated by resident producers plus net taxes (excluding subsidies) on products. In the expenditure approach, GDP is calculated as all final expenditure by individual households and government in purchasers' prices plus gross fixed capital formation and net exports of goods and services. Therefore, other accounts like Quarterly GDP, Institutional Accounts, Supply and Use Table, are not compiled but there is a plan to compile them in the coming years.

Annual GDP estimates by the production approach are presented in both current and constant prices:

1. Gross value added disaggregated by type of economic activity (16 types of main activity) at basic prices; (where Agriculture and Manufacturing industries are further disaggregated into sub sectors)
2. Financial intermediation services indirectly measured (FISIM) (calculated separately and not distributed by type of economic activity);
3. Taxes on products less subsidies on products annually (obtained from annual Government Budgetary Revenue and Expenditure Reports)

Output is estimated in basic prices. Intermediate and final consumption are valued at market prices (Purchaser's or Retail Prices). Gross fixed capital formation is also recorded in market prices. GDP based on the production method is estimated at current and comparable base year prices; however, categories of expenditure GDP are estimated using current year prices (i.e. constant price GDP by expenditure approach is not compiled).

Currently integrated economic accounts are not compiled in Ethiopia. However, there is a plan to compile in the coming years together with other accounts compilation like QNA, SUT.

#### Expenditure Approach

The expenditure approach is used to estimate government final consumption expenditure and exports and imports of goods and services. This approach, in combination with the commodity-flow approach, is also used for estimating gross fixed capital formation.

Final consumption expenditure by households is estimated independently by household consumption & expenditure survey report of the CSA. The expenditure items are classified in accordance to the Classification of Individual Consumption according to Purpose (COICOP). Government final consumption expenditure, consisting of compensation of employees and net purchases of goods and services, is obtained from the annual budgetary revenue and expenditure report, from the Ministry of Finance and Economic Development and from municipalities. These sources are also used for estimating the public sector's capital formation in building and construction. The estimates of private construction in urban areas are based on the construction expenditure from the Ethiopian Investment Agency. Construction in the rural areas is estimated by applying the growth rate of rural and urban housing by 1994 and 2007 housing & population census.

For capital formation in machinery and equipment, annual capital budget expenditure reports from different public enterprises and import statistics are used. To the import values are added import duties, transport costs, trade margins and installation costs. The changes in inventories part includes only the 'livestock change' not the other inventories.

The data on exports and imports of goods and services are obtained from the external trade statistics of the National Bank of Ethiopia. Gross domestic product by expenditure type at constant prices is not estimated.

## **Production Approach**

The table of gross domestic product by kind of economic activity is prepared in basic price values. The production approach is used to estimate value added of most industries where data for output, intermediate consumption and prices are readily available. Where indirect approach is applied, the income and expenditure approach is also used in measuring the output of some sectors of the economy like in the industrial activity and the services sectors.

The estimates of the value added from the agriculture sectors are done by annual agricultural surveys. Value added from Animal Farming is based on the number of livestock by type and their respective productivities on different livestock products like meat, milk, butter, wool, eggs, etc. Benchmark estimates of livestock products and proxy indicators or productivity coefficients are widely used to be extrapolated with annual herd size and where gross output and value added are derived by applying growth factors linked to the population growth rate. For forestry, the sources include the Forestry Department of Ministry of Agriculture, survey report of wood-work industries, and the annual surveys of manufacturing industries. Value added is derived by deducting various IC:GVO proportions for different forest outputs such as industrial wood, firewood, charcoal, etc.

For mining and quarrying activities, annual budgetary reports for the mining sector are used. The value of production is estimated by multiplying the quantity produced of each mineral product by its average price. The source of data for manufacturing sector (large and medium scale, Small scale and cottage and handicrafts) is the annual/benchmark survey of manufacturing industries. Value added is obtained by deducting the cost of inputs of raw materials, fuel and energy, etc. from the gross value of production.

Data for electricity are obtained from annual financial performance reports of Ethiopian Electric Power Corporation (EEPCO). Data on the number of building permits issued, the 1995 and 2000 household expenditure survey and the 1994 and 2007 population census reports by rural/urban residence are used to estimate the value of construction in the private sector. For the public sector, data are obtained from the government annual budgetary revenue and expenditure reports as well as from questionnaires sent to municipalities and public agencies are used. Where appropriate, gross trade margin of imported and locally produced goods is estimated at 15 per cent of the value of imports.

Value added in the transport sector is partially based on the annual reports of concerned enterprises like in the case of railway, water and air transports and partially using data on passenger or ton kilometers, registration statistics, and passenger fares and freight rates in case of road transport. For the financial institutions, the profit and loss statement and the annual reports of concerned institutions are used.

The gross rental income of the urban areas is obtained by multiplying the total number of housing units by assumed actual and imputed average annual rental rates, while for the rural areas the total number of houses is multiplied by the assumed average value per house.

Value added of public administration and defence is equal to total wages and salaries paid to government employees, including payment in kind. The sources of data include annual reports and questionnaires sent to different agencies. For other government services such as education and health, value added is based on government reports. Value added per student enrolled in non-governmental schools is estimated as two-thirds of the value added per student in government schools. The value of domestic services is obtained by multiplying the number of employees by average pay rates obtained from survey reports of the Central Statistical Agency (CSA).

For the constant price estimates, where applicable and direct method of production approach, quantity of current output is revalued at base-year producer prices while in indirect method where expenditure approach is used, value added at current basic prices are deflated using general or sector specific price indices. This approach includes Mining and quarrying, small-scale manufacturing, trade, finance and most of the services sectors. For large-scale manufacturing, electricity, transport, and domestic services, value added is extrapolated by volume indices.

## Faroe Islands

### Source

Response to the United Nations national accounts questionnaire from Statistics Faroe Islands (Hagstova Føroya), Kvíggjartún. Official National Accounts and Balance of Payments are also available at [https://statbank.fo/pxweb/en/H2/H2\\_\\_TB/](https://statbank.fo/pxweb/en/H2/H2__TB/).

### General

The estimates shown in the following tables have been prepared in accordance with the United Nations System of National Accounts 2008 (2008 SNA) as far as the existing data would permit. Previously, the aggregates have been calculated using the System of National Accounts 1993 (1993 SNA).

When the scope and coverage differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables.

In February 2022 Statistics Faroe Islands published a revision of the National Accounts series. The main reasons for the revision have been a better utilization of data sources, a revision of the breakdown of units on industrial and institutional sectors, a revision of the calculation of FISIM and the Balance of Payment being compliant with BPM6.

### Methodology:

#### Overview of GDP Compilation

GDP is calculated using the production, expenditure and income approaches.

Data are compiled only at current prices, with no compilation in constant prices yet.

The compilation of institutional sectors: only the Production account and the Generation of income account are compiled, except for General Government, for which all accounts but the Financial account are compiled.

Gross capital formation is available for the total economy, but not detailed by industry.

Individual consumption expenditure of households is available as a total, but not detailed by COICOP Divisions.

## Fiji

### Source

The preparation of annual national accounts statistics in Fiji is undertaken by the Economic Statistics Division of the Fiji Bureau of Statistics (FBoS), the National Statistics Office which comes under the Ministry of Finance and located in the capital city of Suva. The official estimates for Gross Domestic Product by production are published annually on our website: [www.statsfiji.gov.fj](http://www.statsfiji.gov.fj) as well as in the quarterly publication the "Key Statistics". The report titled "Gross Domestic Product: Production Approach" contains the sources and methods for the compilation of the Current and Constant Gross Domestic Product for Fiji using the Production Approach.

### General

The latest estimates have been prepared in accordance with the classifications and definitions recommended in the United Nations System of National Accounts 2008 (2008 SNA). The economic activities are classified according to the Fiji Standard Industrial Classification (FSIC) 2010 which is a localized version of the International Standard Industrial Classification, Revision 4. When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables and in the compilation manual.

### Methodology:

#### Overview of GDP Compilation

Gross domestic product is estimated mainly through the production approach. Expenditure and Income approach are also compiled.

#### Expenditure Approach

Gross Domestic Product by the expenditure approach is obtained by summing up the expenditure of final users of the goods and services in the economy i.e. Private Final Consumption Expenditure (PFCE) sourced from Household Income and Expenditure Survey (HIES) and thereafter populated using relevant indicators, Government Final Consumption Expenditure (GFCE) sourced from the report "An Economic and Functional Classification of Government Accounts", Gross Fixed Capital formation (CFCF) sourced from business survey reports and "An Economic and Functional Classification of Government Accounts" reports, Change in Stocks is sourced from business survey reports and Exports (X) less Imports (M) sourced from balance of payments.

#### Income Approach

The components of the Income approach to GDP compilation are Compensation of Employees (COE), the Operating Surplus (OS), Consumption of Fixed Capital (CFC) and Net Taxes on Production and Imports. Data are sourced from Government Account for the Central government whereas data for the Private sector and Public Enterprises are sourced from enterprise surveys and taxation data. Estimates of Taxes on production and imports are based on government accounts.

#### Production Approach

Gross Domestic Product by the production approach is equal to the value of all goods and services produced in the economy (i.e. output) less the value of all goods and services used in the production process (i.e. intermediate consumption) plus taxes less subsidies on product. For industries where services are delivered by the General Government e.g. Education, the Value Added is calculated as sum of the wages and salaries paid and consumption of fixed capital due to the absence of a significant market price on such outputs.

The compilation of GDP involve the collection of data of goods and services in the base year prices of the main Industries of the economy as categorised in the Fiji Standard Industrial Classification (FSIC) in the following groups: 1) Agriculture, Forestry and Fishing, 2) Mining & Quarrying, 3) Manufacturing, 4) Electricity, 5) Water and

Sewerage, 6) Construction, 7) Wholesale, Retail, Trade, 8) Food and Accommodation, 9) Transport & Storage, 10) Information and Communication, 11) Finance, 12) Real Estate, 13) Professional, 14) Administrative, 15) Public administration, 16) Education, 17) Health and social work, 18) Arts, Entertainment and Recreation, 19) Other services, are sourced from surveys of all economic sectors. Information on government is sourced from government accounts.

In the case of GDP at constant price, a year considered to be a normal year is chosen as the base year and the output of each economic industry is worked out as a percentage of the total which reflects the importance (weight) of the sector relative to the total economy.

## Finland

### Source

Response to the National Accounts Questionnaire from the Statistics Finland, Helsinki. The official estimates are published in 'Kansantalouden tilipinto', Statistics Finland.

Detailed methodology of the Finish national accounts could be found in Statistics Finland website: [http://tilastokeskus.fi/til/ekt2010\\_en.html](http://tilastokeskus.fi/til/ekt2010_en.html) and [http://tilastokeskus.fi/meta/til/vtp\\_en.html](http://tilastokeskus.fi/meta/til/vtp_en.html).

The data provided to UNSD is received through the Organisation for Economic Cooperation and Development (OECD), Paris.

### General

From September 2014, these national accounts estimates are compiled according to the 2008 SNA ('System of National Accounts 2008', Commission of the European Communities-Eurostat, International Monetary Fund, Organisation for Economic Co-operation and Development, United Nations and World Bank, 2009).

The financial intermediation services indirectly measured (FISIM) are allocated to industries and institutional sectors.

Original chain constant price estimates are referenced to 2015.

### Methodology:

#### Overview of GDP Compilation

Gross domestic product is mainly estimated through the production approach. Expenditure approach is also independently calculated. Income approach can not be considered as independent as other two approaches, but the sum of income components are determined according to the other two approaches. Supply and use tables and input-output tables are compiled annually for definitive estimates for t-2 of annual accounts.

National accounts present the central parameter figures of gross domestic product and gross national income, and their components, that describe the state and development of Finland's national economy. Data on the output, income, use of income and capital formation of the national economy are described by transaction and sector. Data on output, employment and capital formation are presented by transaction and industry. Data on consumption are presented by purpose and durability category. Data describing the activities of general government are also presented by function. There is also information about taxes and social insurance contributions compliant with national accounts. Supply and use tables present data on the supply and demand of the national economy by product group.

Capital stock is estimated with a calculation model based on the method for accumulation of investments. Total stock is calculated both as gross and net concepts. Data on capital stock are used in productivity calculations and as estimates of fixed capital depreciation in national accounts. Fixed capital reserves is a crucial element in determining national wealth.

The data system of national accounts is comprised of a host of basic statistics, diverse registers and separately collected data. Most of the data are public, but individual data on specific units may not be disclosed.

The classifications used in the compilation of the national accounts are the Classification of Institutional Sectors 2012, Standard Industrial Classification TOL 2008, classification of producer categories, classification of transactions in accordance with ESA 2010, classification of types of capital goods, COICOP Classification of Individual Consumption According to Purpose, CO-FOG Classification of the Functions of Government. The product classification used in the supply and use tables is a national accounts product classification based on the

Statistical Classification of Products by Activity (CPA) of the European Union. The classifications are based on the standards require by the European System of Accounts ESA 2010.

Data coverage includes the Aland Islands.

## **Expenditure Approach**

In the national accounts, GDP is determined on the basis of the production approach. The expenditure approach is also taken into account independently. The difference in GDP, as calculated by the production and expenditure methods of approach, is recorded as a statistical discrepancy in the preliminary national accounts. In the final figures, supply and demand are balanced on a product by product basis and no statistical discrepancy occurs.

The use of products is valued at purchasers' prices. Final consumption expenditure therefore includes value added tax and other product taxes, but not subsidies. The products acquired by instalment payments or an equivalent credit system are recorded by their date of purchase.

Benchmark estimates for household final consumption expenditure are based on household budget survey which is in Finland conducted every three to five years. Annual calculations are based on sales statistics and other sources and the commodity flow method. Calculations are made on the level of 182 headings of COICOP.

For use of owner-occupied dwellings the corresponding market rents are imputed. For price data the consumer price index is largely referred to.

The estimates of government final consumption expenditure are derived from production accounts compiled on the basis of the central government accounting data, local government financial statistics, statistics on employment pension funds and data on Social Insurance Institution.

Civil engineering work is based on structural business statistics, central government accounting data and local government financial statistics and other data sources by industries.

Gross fixed capital formation includes value added tax insofar as it is not tax deductible. Investments are recorded according to the date of the transfer of assets. There are three exceptions to this rule in the national accounts. First, financial leasing is recorded as an investment by the industry using it, even if there is no change of ownership. Secondly, own account investments are recorded when they are produced. Thirdly, construction investments are recorded as they are built and not after completion of the building, when ownership generally changes hands. Estimates for gross fixed capital formation in machinery and equipment and transport equipment are based on several statistical sources, most important are structural business statistics and the local government financial statistics.

Estimates for investments on residential and other buildings comprise new construction, refurbishments and commissions and fees. Investments are estimated at purchaser's prices and they include value-added tax, insofar it is not deductible. Own-account construction is included. Starting point for estimates is output of construction industry, but estimates for demand side are calculated as well by industries. Benchmarks and extrapolation based on special reports are also used to calculate gross fixed capital formation of building refurbishment contained in estimates of investments in the building construction.

Change in inventories is valued at the average price for the year, i.e. the value of opening and closing stock is averaged for the year and then the difference between them is calculated. The data on changes in inventories are based on structural business statistics and information of public inventories and agriculture.

Goods imported and exported are valued at their f.o.b. value, i.e. their value when they leave the port of the exporting country. Exports of services are valued at basic prices and imports of services at purchasers' prices. The estimates of exports and imports of goods and services are based on foreign trade statistics, survey on international trade and other sources for services. In general estimates are same for balance of payments.

Ultimately, the co ordination and balancing of the production and expenditure approaches will be ensured by the supply and use table method, which provides assurances regarding a systematically exhaustive approach, also with respect to the estimation of GDP expenditure components.

## **Income Approach**

In Finland's national accounts, GDP is not independently calculated using the income approach because sources for gross operating surplus are not reliable enough as an independent estimate. Gross operating surplus is calculated as a residual in market production, when other income components have been deducted from gross value added.

The income components of GDP are calculated using the same industry and producer type classification (in generation of income accounts) as was used for gross value added in the production approach. However, wages and salaries and employers' social contributions are calculated in two ways. Firstly, wages and salaries are calculated as the total for the overall economy mainly from aggregate data sources and secondly, by industry. Sometimes earnings calculated by industry do not tally with the sum calculated for the overall economy. Balancing is made so that the discrepancy is adjusted in relation to the wages and salaries of the market producers calculated by industries. A correction in the opposite direction is made to the operating surplus. Employers' social contributions are adjusted with the same method separately.

The key data source of wages and salaries for the overall economy is the taxation levy statistics by the National Board of Taxes. Main data sources by industry are structural business statistics, the Business Register, the local government financial statistics, consolidated accounting data and the Financial Statement and Report of Central Government, banking statistics and insurance corporation statistics. Some industries use an indirect estimating method, such as price by volume type estimates in which the average hourly pay is multiplied by the number of hours worked.

Employers' social contributions for the overall economy are calculated using direct sources from institutions which collect contributions (e.g. Social Insurance Institution, employment pension funds).

Employers' social contributions by industry and payment type are generally calculated by the so called percentage payment method. The difference between data by industries and data for the overall economy is then adjusted to industries.

Operating surplus is basically derived as a residual item by industries and if necessary, adjusted according to correction of wages and salaries and employers' social security contributions.

Consumption of fixed capital is obtained by using the perpetual inventory method.

Other taxes on production and other subsidies on production are obtained from the government data.

## **Production Approach**

When preparing Finland's national accounts, the production approach is primary in calculating GDP. Allowance is also made for the expenditure approach when balancing the accounts.

Gross value added at basic prices is equal to the total of gross value added by industry. Definitive estimates are calculated and balanced in the supply and use tables on a product by product basis. When taxes on products are added to and subsidies on products are deducted from gross value added at basic prices, gross value added at market prices or GDP is obtained.

In the production approach to preparing Finland's national accounts, the statistical units are the product, the establishment and the institutional unit. The establishment is equivalent to the local kind of activity unit (KAU), as defined in ESA 95. The institutional sector, however, remains the core reference and is also the basic framework

used for inspections proper to each industry. Calculations are made on the level of 15 sectors, 183 industries (100 industries in the preliminary calculations), 3 producer types and 952 product groups.

The main data source for assessing the output and/or intermediate consumption of many industries is the structural business statistics of the industry concerned. The Business Register, the business income tax register (EVR) and direct survey data are combined in structural business statistics. These statistics are based on concepts of enterprises' profit and loss accounts and the EU regulation on structural statistics.

Many information sources proper to each industry are also used. The main data sources in non market production are consolidated accounting data and the Financial Statement and Report of Central Government, and local government financial statistics.

The compilation of Finland's national accounts relies mainly on source statistics drawn up each year. Benchmarks and extrapolation are used to calculate output in just a few industries.

## France

### Source

Response to the National Accounts Questionnaire from the 'Institut National de la Statistique et des Etudes Economiques (INSEE)', Paris. The official estimates are published in 'Comptes de la nation', INSEE.

Detailed methodology of the French national accounts could be found in the INSEE website:  
<http://www.insee.fr/en/themes/comptes-nationaux/default.asp?page=base-2010.htm>.

The data provided to UNSD is received through the Organisation for Economic Cooperation and Development (OECD), Paris.

### General

From September 2014, these national accounts estimates are compiled according to the 2008 SNA ('System of National Accounts 2008', Commission of the European Communities-Eurostat, International Monetary Fund, Organisation for Economic Co-operation and Development, United Nations and World Bank, 2009) Previously the estimates were prepared in accordance with the United Nations System of National Accounts 1993 (1993 SNA). The latest data input-output tables valued at market prices are an integral part of the French national accounts and are published every year. When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables.

Chain indices are used to measure volume growth and the resulting chained constant prices data, 2014 base, are not additive.

The financial intermediation services indirectly measured (FISIM) are allocated to industries and institutional sectors.

On 1 January 1999, the conversion rate of the national currencies to the new currency euro was irrevocably fixed and the euro became the single currency of the 11 member countries of the European Monetary Union (EMU). For these 11 countries, all data starting 1999 is in euro. The newly submitted data for the years before 1999 were reported in national currency but were converted to 'euro' using the fixed exchange rates to allow for easy comparison of national time series data. In this publication the currency name of this data consists of the year of accession plus the ISO currency code of the national currency and the word 'euro'. In the case of France the currency name for the data before 1999 is "1999 FRF euro". For international comparisons, like for example when converting national data into US dollar the data before the euro introduction has first to be converted back into national currency using the fixed 6-digit Euro conversion rate of 1 Euro = 6.55957 French franc. The name of the currency of the newly submitted data is "1999 FRF euro" for the data before 1999 and "euro" for the data from 1999 on. In the database, this newly submitted data is stored as a new series of data and will be shown in this yearbook as a new row of data if in the same table there is also previously submitted data. Previously submitted data for France, like old data following the 1968 SNA is still in "French franc", although this is not specifically indicated in the tables.

### Methodology:

#### Overview of GDP Compilation

The economic territory for which the French national accounts are compiled includes the so-called "overseas departments" (French Guyana, Guadeloupe, Martinique, and Réunion), and excludes other kinds of overseas territories (e.g. New Caledonia). Some units located in the other overseas territories may be included in the French economic territory to the extent that they constitute military bases or scientific stations. For example, the military base located in French Polynesia is included in the French economic territory while French Polynesia as such is not. The same holds for scientific stations situated on the Antarctic continent.

French Quarterly National Accounts are based on the European System of Accounts 2010 (ESA 2010) and 2008 SNA and are compiled using both production and expenditure methods.

GDP measures the total value of final goods and services produced by domestic institutional units during the period.

### **Expenditure Approach**

For each commodity of the input-output table classification, a commodity-flow balance is built, generally by aggregating and completing balances elaborated at a more detailed level of the classification. Sources allowing the household private consumption to be estimated are infra-annual inquiries on production combined with foreign trade data at a very detailed level of the classification, households surveys and specific information relating to such expenses as health or dwelling. Estimates relating to goods are compared with information about the retail trade turnover. Gross fixed capital formation estimates proceed from the commodity flow balances compared with information originating in the investors business accounts at a rather aggregated level. Changes in producers stocks come from the breakdown, by product, of stocks held at the beginning and at the end of the year by enterprises and from an estimate of the holding gains accruing on goods held in stock. Users and trade stocks are estimated by composing intermediate and households consumptions estimates in the commodity flows. Foreign trade comes from the customs statistics and the balance of payments services exchanges, completed by some ad-hoc sources.

### **Income Approach**

Three basic sources are used to estimate the cost-components of the different institutional sectors. First, individual accounting data which are not adjusted: government administrations, large public corporations, financial institutions and insurance companies. Second, data on firms (non-financial corporations excluding large public corporations and private unincorporated non-agricultural enterprises) originating from fiscal information which are adjusted to take into account absences, tax cheating and evading and made consistent with corresponding data obtain from the first source. Third, statistics not originating in the centralization of individual accounting data: unincorporated agricultural enterprises, some productions of households (rental services of dwellings, self consumption of agricultural products, domestic services), private non-profit institutions.

### **Production Approach**

The estimates of the production of non-financial and non-agricultural firms by industry, except large public national firm start from the sales as reported in the firms' fiscal returns. The part of the production which is not properly reported in the sales - inter-establishment deliveries, production for own capital formation, subcontracting and processing of customers owned materials - is added up in order to obtain non-stocked production estimates. Accounting data of financial institutions, insurance companies and large public corporations which are processed separately make it possible to estimate the output of the corresponding industries. Agriculture production indirectly estimated from products sources while trade output is estimated from trade margins by product and type of use. The estimates of the production of government industries come from data supplied by concerned units. Non-market services output is obtained as the sum of the costs. With the exception of some rows or columns, or more generally of some cells, of the intermediate consumptions table, the intermediate consumptions are calculated, for current year in an indirect way, that is, the principle consists in projecting the preceding year table assuming that the technical coefficients remain unchanged at constant prices. The adding up of the estimates in row, i.e., the projected total intermediate consumption for each product, is compared with the intermediate demand as estimated from the commodity-flow balances (see gross domestic product by expenditure).

**Table 1.1 Gross domestic product by expenditures at current prices**

## French Polynesia

### Source

Response to the United Nations national accounts questionnaire from the Institut de la statistique de la Polynésie française (ISPF), Papeete. Official estimates and descriptions are published by the same Institute in "Comptes Economiques de la Polynesie Francaise", available at <http://www.ispf.pf/ISPF/GdInd/CompteEco.aspx>.

### General

The estimates shown in the following tables have been prepared in accordance with the United Nations System of National Accounts 1993 (1993 SNA). When the scope and coverage differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables.

## Gabon

### Source

In Gabon national accounts are exclusively developed by the Department of Statistics. However, the Department of Economics sometimes produces projected accounts. These two agencies are under the Ministry of Economics, Trade, Industry and Tourism.

Official national accounts statistics are published in a single publication, the "National Accounts of Gabon". The same publication can sometimes be found on the website of the Statistics Department ([www.stat-gabon.ga](http://www.stat-gabon.ga)).

### General

Gabon began to revise its national accounts in 2001 by switching to the System of National Accounts 1993 (1993 SNA). The entire set of accounts from 2001 to 2008 was therefore prepared in line with this system, using 2001 as the base year. Backcasting work is under way to update the old series of national accounts (prior to 2001). The most recent national accounts publications prepared in line with 1993 SNA are the 2001-2005 accounts series using the ERETES information system, and the 2006-2008 rapid accounts series.

Only annual accounts are prepared for the time being in Gabon; efforts are being made to develop an annual calendar for the publication of results.

The basic changes made to the national accounts are consistent with Gabon's willingness to comply with the requirements of the Economic and Statistical Observatory of Sub-Saharan Africa (AFRISTAT) that all member countries should switch to 1993 SNA and use the ERETES information system to prepare their national accounts using 2001 as the common base year.

The various national accounts aggregates at constant prices are computed by using a volume index based on the previous year's accounts because the aggregates computed on the basis of chain 2001 base year index yield results that are too far removed from current prices. The fiscal year used for national accounts is the calendar year.

## Gambia

### Source

Response to the United Nations national accounts questionnaire from the Gambia Bureau of Statistics, Ministry of Finance & Economic Affairs, Banjul. The official estimates together with sources and methodology are published on our website: [www.gbos.gov.gm](http://www.gbos.gov.gm).

### General

The estimates shown in the following tables (production approach) have been prepared in accordance with the United Nations System of National Accounts 2008 (2008 SNA) so far as the existing data would permit. Previously, data have been prepared in accordance with the United Nations System of National Accounts 1993 (1993 SNA).

The estimates are published for the production and expenditure approaches.

The second Economic Census and Establishment Survey were conducted in 2014 and 2015 respectively after which the ISIC Rev. 4 is now used to disaggregate GDP by economic activity and at the four-digit level.

## Georgia

### Source

National Accounts Department of the National Statistics Office of Georgia (Geostat) is responsible for compiling and disseminating official national accounts statistics. National accounts are disseminated in the following publications:

- Statistical Yearbook of Georgia (<https://www.geostat.ge/en/single-categories/95/statistical-yearbook>)
- National Accounts of Georgia (<https://www.geostat.ge/en/single-categories/113/gross-domestic-product-of-georgia>) and
- Quarterly Bulletin (<https://www.geostat.ge/en/single-categories/98/quarterly-bulletin>).

Press-releases about rapid estimates of economic growth (monthly), quarterly GDP, annual GDP as well as regional GDP are published on the website of Geostat (<https://www.geostat.ge/en/news>).

National accounts data are available in Excel (<https://www.geostat.ge/en/modules/categories/22/national-accounts>) and PC-Axis (<http://pc-axis.geostat.ge/PXWeb/pxweb/en/Database/>) format.

The data is accessible in mobile applications for Android and iOS system phones as well.

### General

Methodological basis for the national accounts of Georgia is based on the System of National Accounts 2008 (2008 SNA). The 2008 SNA was adopted on November 15, 2019. With the adoption of the 2008 SNA, the historical time series from 2010 were revised.

Data dissemination dates are set out in the Annual Statistical Work Program, which is publicly available on the Geostat website (<https://www.geostat.ge/en/modules/categories/307/statistical-work-programme>). A schedule for the data publication is available under the section of calendar on the web page of Geostat (<https://www.geostat.ge/en/calendar>).

Preliminary quarterly GDP data are initially published on the 80th day after the end of the calculating quarter. Preliminary annual GDP data are published together with the 4th quarter data of reporting year on the 80th day after the end of the fourth quarter of the calculating year. After receiving annual survey results, quarterly and annual GDP figures are finally revised and published by the 11th month after the end of the reporting year.

### Methodology:

#### Overview of GDP Compilation

GDP is compiled by three methods in Georgia: Production approach, Expenditure approach and Income approach. Production approach is considered as a main method for GDP calculation.

Calculation of GDP by the production approach is based on the National Classification of Economic Activities of Georgia (GNC 006-2016), which is based on standards of Classification of Economic Activities in the European Community (NACE Rev. 2).

Data sources for GDP compilation are based on surveys conducted by Geostat or administrative data. Data obtained from the internal sources of Geostat include:

- Data on the economic activities of non-financial corporations (Statistical Survey of Enterprises);
- Statistical survey of non-commercial enterprises;
- Data on the economic activity of households (Households Incomes and Expenditures Survey and Labor Force Survey);

- Consumer Price Index (CPI);
- Producer Price Index for Industrial Products (PPI);
- Price Index for Material Inputs to Construction Industries and Producer Price Index for Freight Transport;
- Data on agricultural production;

External data sources:

- Central and general government budget revenues and expenditures (Ministry of Finance of Georgia);
- Balance of Payment (National Bank of Georgia);
- Indicators of national and commercial banks (National bank of Georgia);
- Indicators of insurance companies (LEPL Insurance State Supervision Service of Georgia).

## **Expenditure Approach**

Compilation of annual GDP by expenditure approach is conducted at current and constant prices, while quarterly GDP by expenditure approach is compiled only in current prices.

Final consumption expenditure is calculated using the data from the households Survey of incomes expenditures, general government budget and survey of non-profit institutions.

Gross capital formation is calculated as a sum of fixed capital formation, changes in inventories and net acquisition of valuables. Gross capital formation is calculated by type of assets and institutional sectors based on the information from the following sources: survey of non-financial institutions, Survey of financial institutions, general government budget, survey of agriculture, survey of non-profit institutions. Changes in inventories is calculated as a difference of balance values at the end and the beginning periods of unfinished production, stocks of finished goods, stocks of goods for resale and stocks of raw and other materials. Holding gains is excluded from the value of changes in inventories. Net acquisition of valuables is not evaluated.

Data on export and import of goods and services are derived from the balance of payments data.

## **Income Approach**

Data obtained from internal and external sources are processed in a special format needed for the national accounts. GDP by Income approach is calculation scheme as follows: Employment income in the form of wages, salaries and social benefits is based on an administrative source, Taxes less subsidies are also collected from General Government Budget data, Operating surplus and mixed income is calculated as a residual. GDP by income approach is compiled only in current prices.

## **Production Approach**

Non-observed economy including illegal activities is included in the GDP estimates, which is measured by types of economic activities considering information on activities, output, income, consumption and other economic operations missed from the existing standard statistical sources. Direct as well as indirect measurement methods are used to assess non-observed economy.

Calculation of GDP in constant prices by production approach is implemented using the method of double deflation. It is conducted by subtracting deflated intermediate consumption from the deflated figure of output.

## **Overview of the Compilation of the Integrated Economic Accounts**

Integrated economic accounts are compiled for the whole economy, without disaggregation on institutional sectors. Compilation of integrated economic accounts for institutional sectors is planned by 2021. The sequence of accounts for Georgia includes all accounts provided in the 2008 SNA including capital account. Balance of payment data is primarily used for accounting transactions with the rest of the world.

## Germany

### Source

Data compiled by the Statistisches Bundesamt, Wiesbaden and provided to the OECD by Eurostat.

### General

From September 2014, these national accounts estimates are compiled according to the 2008 SNA ('System of National Accounts 2008', Commission of the European Communities-Eurostat, International Monetary Fund, Organisation for Economic Co-operation and Development, United Nations and World Bank, 2009).

Detailed methodology of the German national accounts could be found in the Bundesamt website: [https://www.destatis.de/EN/Methods/NationalAccountRevision/Revision2014\\_BackgroundPaper.pdf?\\_\\_blob=publicationFile](https://www.destatis.de/EN/Methods/NationalAccountRevision/Revision2014_BackgroundPaper.pdf?__blob=publicationFile)

The financial intermediation services indirectly measured (FISIM) are allocated to industries and institutional sectors.

Original chain constant price estimates are referenced to 2015.

The statistics for Germany in this publication refer to Germany after unification. Official data for Germany after unification are available only from 1991 onwards. In order to calculate the various zones totals, the secretariat has estimated data for the whole of Germany back to 1970 by linking in 1991 the data for Germany to historical data for West Germany according to 1993 SNA published in September 2006 by the Statistisches Bundesamt.

### Methodology:

#### Overview of GDP Compilation

The German system of National Accounts (NA) is based on the European System of National Accounts (ESA 2010), which in turn originated from the System of National Accounts (2008 SNA). Yearly and quarterly data for Germany according to ESA 2010 start at the beginning of 1991. In addition, data for the Former Federal Republic of Germany according to ESA 1995 is available for the years 1970 to 1991. GDP measures the market value of goods and services that are produced in Germany, after deduction of intermediate consumption but before deduction of consumption of fixed capital.

The following features are published for the annual national accounts data: gross value added, gross domestic product and gross national income; taxes and subsidies on production according to 64 economic branches; values of production, intermediate consumption and gross value added at current prices and at previous year's prices (chain-linked indices) according to 64 economic branches; private consumption; private consumption by supplier branches; purchases of private households domestically by uses; consumption expenditure of general government, gross fixed capital formation by sector and type of investment; gross fixed capital formation (new goods) by 64 economic branches at current prices and at previous year's prices (chain-linked indices); gross fixed capital formation by commodity groups; changes in inventories; imports and exports of goods and services, imports and exports of goods and services by commodity groups at current prices and at previous year's prices (chain-linked indices), economic transactions with the rest of the world; distribution of wage and property income; compensation of employees; gross wages and salaries total (domestic); income from entrepreneurial activity and property (before and after redistribution); net national income (market prices and factor costs); disposable income and its uses; saving and capital accumulation; general government revenue and expenditure as well as net lending / net borrowing (total, political subdivisions: federal /central government, state government, local government, social security funds); government expenditure by function; completed state transfers by function; gross capital formation of general government by function; taxes; social contributions; actual social contributions; social benefits; private household income and its use; reproducible tangible assets by type of asset and capital assets (gross, net) by economic branch at replacement prices and at previous year's prices (chain-linked indices).

The breakdown of economic branches in the German NA is based on the ESA 2010, but not all details are published. The industrial classification used is the Statistical Classification of Economic Activities in the European Communities NACE Rev.2; the details are published generally at the one or two digit level. Products are classified by the Classification of Products by Activity (CPA). Machinery and equipment is classified by the List of Products of the European Communities (PRODCOM), which is identical to the CPA up to the six-digit level. The Classification of Individual Consumption by Purpose (COICOP) serves to break down household final consumption, and the Classification of the Functions of Government (COFOG) is used to classify functions of government.

Transactions are valued in market transactions with actual market prices. Non-market transactions should be valued as much as possible at market prices (for example, the rental value of residences used by owners). When this is not possible, production prices including profit surcharge (for example, self-built facilities) or without profit surcharge (for example, the value of state production) are quoted. In certain isolated cases (for example, commerce and credit institution services) the value is determined as the difference between certain revenues and expenditures.

## **Expenditure Approach**

Three main methods can be used to compute the gross domestic product (GDP) via the expenditure approach. Firstly, the buyers or users of goods can be asked about their expenditure. Secondly, the producers of goods and services can be asked about their deliveries to consumers, investors and the rest of the world. Thirdly, an estimation of the use structures for goods and services (commodity flow method) can be applied.

Currently, consumption expenditure of private households is calculated mainly by using the so-called supplier method, whereby information about suppliers' sales to private households (in particular the sales of retail and wholesale trade) are used to determine consumption expenditure. These results are complemented by special product-related calculations, e.g., for tobacco goods, motor vehicles, and fuels. Statistical sources are, among others, annual business surveys in industry, trade, and most transport sectors, the turnover tax statistics, and multi-year censuses resp. register-based data.

The consumption expenditure of general government is calculated by deducting the sales revenue of non-market output and the self-produced fixed capital formation from the current expenditure for the non-market output of this sector (intermediate consumption, compensation of employees, capital consumption, and other net taxes on products), adding the social benefits in kind. The statistical sources are the results for the federal budget, the results of the finance statistics, broken down in detail according to types of income and expenditure, and the results from social insurance bodies.

For the computation of fixed capital formation, the commodity-flow method is mainly used. Important sources for estimating fixed capital formation are the annual survey of companies employing 20 or more workers, the annual census in the construction industry, the cost structure statistics, the turnover tax statistics, the monthly foreign trade statistics, the quarterly production statistics, and the monthly sales survey in the capital goods producing sector are important sources for estimating fixed capital formation.

Changes in inventories are generally calculated by converting survey data on the initial and closing inventories (book values) using a model in accordance with the concepts of ESA 1995. Important statistical information is provided by the cost structure statistics in the various industries and price indices from the price statistics.

The value of exports and imports is obtained from the foreign trade statistics and from the balance of payments statistics of the Central Bank.

## **Income Approach**

Compensation of employees includes gross wages and salaries as well as actual and imputed social contributions of employers. Main data sources are employers' monthly, quarterly, and annual reports and special surveys among employers that are conducted every few years, such as the survey on labour costs. Data from social security

statistics is also used. Indirect taxes and subsidies are taken directly from the general government accounts. Operating surplus is then obtained as a residual.

## Production Approach

The table of GDP by kind of economic activity shows the GDP at market prices and the GVA at basic prices. The production approach for output is used to estimate value added of most industries. The income approach is used to estimate value added of domestic services, private non-profit institutions, and producers of government services.

Value added of agriculture is obtained by deducting the cost of all intermediate consumption from the gross value of production, which includes products consumed on farms. The calculations are based on production statistics for quantities and on agricultural price surveys for prices.

The main sources for estimating output and intermediate consumption (ratios) for mining and quarrying, manufacturing, electricity, gas and water, and construction are the yearly structural business statistics (SBS) of production industries (cost-structure statistics) and annual data taken from several other sources for crosschecking (VAT statistics, business register).

For trade as well as hotels and restaurants the output is calculated by turnover data from SBS, VAT statistics, and business register, while input is estimated from SBS and for some smaller parts from annual trade reports. For the transport sector, SBS are used to estimate parts of output and intermediate consumption for most sub-sectors. Turnover tax statistics are used to prepare the current output estimates, too.

Banking statistics, collected by the Central Bank, and insurance statistics, collected by the Federal Supervisory Board, provide the basis for estimating output of financial institutions including insurance. Input is estimated on the basis of bank company reports and insurance company reports. Additionally, FISIM as an important part of output is calculated by using a model based on quantities and interest rates.

Rents are estimated separately by using a model based on different strata like old, medium, and new buildings. The rents are based on data from censuses of buildings and dwellings which include owner-occupied dwellings. The data are extrapolated by quantity and price indices.

The data used to estimate value added of government services are mainly based on revenue and expenditure statistics of general government. For private non-profit institutions, output is estimated as the sum of costs for wages and salaries, estimated capital consumption, and other net taxes on production. Double deflation is used for the calculation of price-adjusted results for gross value added. Output of most industries is deflated by weighted producer price indices. For almost all industries, the inputs are deflated by specially constructed input price indices.

## Ghana

### Source

National accounts are compiled and disseminated by the Statistical Service of Ghana. National accounts aggregates are compiled at current and constant prices. Annual national accounts of Ghana are compiled and disseminated in annual and quarterly publications of the Service. These include the Economic Survey Report, Press releases and Macroeconomic data bulletin. Also, quarterly revised estimates on GDP from the production and the expenditure approaches are posted on the internet at [www.statsghana.gov.gh](http://www.statsghana.gov.gh).

### General

The system of national accounts used in Ghana is based on the methodological framework of the System of National Accounts 2008 (2008 SNA). This methodological framework of 2008 SNA was adopted after rebasing the base year from 2006 to 2013.

The activity classification used for presentation of the production account is the International Standard Industrial Classification of All Economic Activities, Rev.4 (ISIC Rev. 4).

The Classification of Individual Consumption According to Purpose (COICOP), the Classification of the Functions of Government (COFOG), and the Standard International Trade Classification (SITC) and the Broad Economic Classifications (BEC), as well as statistical information from the balance of payments are used to calculate GDP from the expenditure side.

### Methodology:

#### Overview of GDP Compilation

The GDP of Ghana is estimated using the production and expenditure approaches. The main method of compiling GDP indicators is the production approach.

GDP data are disseminated in current and constant prices. Quarterly GDP is disseminated in constant 2013 prices and like the annuals, Quarterly GDP cover the entire economy of Ghana. Benchmarking and seasonal adjustments techniques are applied.

Output is estimated at basic prices. Constant price value added of economic activities in Ghana is generally compiled using these methods: (a) single extrapolation of base year value added by deflated gross output measures e.g. the Industrial sector output deflated by the PPI; (b) single extrapolation of base year value added by volume/quantity measures such as volume of trade and physical units of outputs. FISIM is redistributed across users.

#### Expenditure Approach

The main sources of data are Household income and expenditure surveys, Report and Financial Statement of Public Accounts, Balance of payments data and External trade statistics and government fiscal tables. The calculation of household expenditure on goods and services for final consumption is based on Expenditure of households on consumer goods grouped according to COICOP as captured in the household survey (Ghana living Standard Survey, GLSS).

Data on final consumption by government ministries and agencies are compiled on the basis of individual and collective expenditure of goods and services published in the Report and Financial Statements of the Public Accounts on the consolidated fund of Ghana.

Expenditure on final consumption of non-profit institutions serving households (NPISH) consists of expenditure of those institutions on consumer goods and services provided to households free of charge or at prices that are not

economically significant. The main sources of financing for their expenditure are members' contributions, donations and other transfers. NPISH expenditure on final consumption includes that of trade unions, foundations, associations, political parties, religious organizations and independent organizations.

Data on gross fixed capital formation is compiled using data from the economic survey for the base year 2013 in addition to administrative data. The calculation includes the estimation of roads, buildings (residential and non-residential), and also other construction, as well as expenditure on the purchase of equipment (machinery and transport).

The volume of exports and imports of goods and services in current prices is determined on the basis of data from the balance of payments. Both exports and imports are expressed at f.o.b. prices. The balance-of-payments data are expressed in United States dollars; the value in sums can be obtained by multiplying by the average quarterly exchange rate of the sum to the dollar, while the annual value is obtained from the sum of the quarterly figures.

The constant prices are obtained by deflating the components of Expenditure – based GDP by the appropriate deflators.

## **Production Approach**

Using the production method, GDP is calculated in both current and constant prices. Its value is obtained by calculating the sum of the gross value added in each sector (in basic prices) plus net taxes (less subsidies) on products and imports.

The primary data sources are:

- (a) Value Added Tax (VAT)
- (b) The annual and quarterly reports on income and expenditure of state and private enterprises on all types of economic activity
- (c) Quarterly Profit and Loss Account for Banking industry
- (d) Composite Annual accounts of Insurance Industry
- (e) Fiscal tables prepared by the Ministry of Finance and Statistical bulletins from Bank of Ghana.

The deflators such as CPI, PPI, and Wholesale price Index for Agricultural crops are used to obtain GDP at constant 2013 prices.

For the agricultural sector, the main sources of data on agricultural production are the Statistics, Research and Information Directorate (SRID) of the Ministry of Food and Agriculture (MoFA), the Animal Health and Production Department (AHPD) of MoFA, Ghana Cocobod, Forestry Department, and Fisheries Department. Also, data from censuses and surveys such as the Ghana Living Standard Surveys are also used. The value added from Agriculture and Allied Activities is the sum of the value added from all the different activities included under this sector: growing of food crops; fruits, nuts, vegetables and other crops; cocoa production; livestock and poultry; hunting, trapping and gathering; forestry and logging; and fishing.

The sub-sectors of the industry sector are mining and quarrying; manufacturing; electricity and water; and construction. For the construction sector, data on works undertaken by the government are obtained by analyzing the government accounts. Information on domestic production, imports and exports of construction materials, trade and transport margins and cost-composition of the total expenditure are available to prepare estimates of gross output. VAT data is extensively used in estimating the gross value added for the manufacturing subsector and it's deflated by its sub-components of PPI to obtain the constant prices.

The sub economic activities under the services sectors include trade, education, and health and social work. The others are transport and storage; information and communication; real estate; business services activities; and financial and insurance activities; as well personal and social activities.

The output indicator for extrapolation is determined on the basis of the statistical data. In the case of education,

enrolment of school categories are used; outbound calls per minute is used as an indicator for extrapolation for the communication sector; and volumes of cargo loaded and unloaded for transport and storage. Different kinds of price indexes are used to deflate the value added of restaurants and hotels as well as the business, financial and insurance activities.

## Greece

### Source

Response to the National Accounts Questionnaire from the National Statistical Service of Greece, Athens. The official estimates are published in 'National Accounts of Greece', National Statistical Service of Greece.

Detailed methodology of Greek national accounts could be found in EL.STAT website:

[http://www.statistics.gr/portal/page/portal/ESYE/BUCKET/A0702/PressReleases/A0702\\_SEL15\\_DT\\_AN\\_00\\_2013\\_02\\_F\\_EN.pdf](http://www.statistics.gr/portal/page/portal/ESYE/BUCKET/A0702/PressReleases/A0702_SEL15_DT_AN_00_2013_02_F_EN.pdf)

The data provided to UNSD is received through the Organisation for Economic Cooperation and Development (OECD), Paris.

### General

From September 2014, these national accounts estimates are compiled according to the 2008 SNA ('System of National Accounts 2008', Commission of the European Communities-Eurostat, International Monetary Fund, Organisation for Economic Co-operation and Development, United Nations and World Bank, 2009).

The financial intermediation services indirectly measured (FISIM) are allocated to industries and institutional sectors.

Original chain constant price estimates are referenced to 2015.

### Methodology:

#### Overview of GDP Compilation

GDP measures the market value of the goods and services produced in Greece after the deduction of intermediate consumption and before the deduction of consumption of fixed capital.

The classification of institutional units and transactions used for compiling annual national accounts is in accordance with ESA 2010. The quarterly accounts follow the same classification systems. The industrial classification used is the Statistical Classification of Economic Activities in the European Communities NACE Rev.2. Products are classified by the Classification of Products by Activity (CPA). Household expenditure is classified by COICOP.

GDP is recorded at market prices; GDP components are recorded at market prices, while value added is recorded at basic prices. GDP components are estimated at current prices, previous year's prices and chained-linked volumes. Income aggregates are estimated only at current prices.

Data are disseminated in millions of euro on the Gross Domestic Product at current prices and chain-linked volume measures (reference=2010) for the expenditure and production approach. Only data at current prices are produced for the income approach. GDP data are disseminated in seasonally and non- seasonally adjusted formats.

The following breakdowns are disseminated:

1. Production: nominal and real results for GVA according to A10 classification.
2. Expenditure: nominal and real results for all expenditure components.
3. Income: nominal results for compensation of employees by industry (A10), GOS, taxes and subsidies.

## Expenditure Approach

Households' final consumption expenditure is compiled by using short term retail trade statistics, and commodity flow method for most services. Consumer Price Index is used for deflation purposes. General Government consumption expenditure: STPFS data. Gross fixed capital formation (GFCF): The estimates for dwellings and other private buildings are based on the monthly volume of building permits issued by the local planning offices. The GFCF estimates for public investments are based on the quarterly data provided by the programme of public investments. Exports and imports of goods and services: External Trade Statistics of EL.STAT is used for the compilation of goods and the BOP data for services. Changes in inventories: Derived as a residual by subtracting the sum of the other expenditure components from total GDP as measured from the production approach.

## Income Approach

Source data provided by the labour force survey (LFS) are used to compile compensation of employees as well as the employment estimation. Labour cost index (LCI) is also used. Taxes and subsidies are provided from STPFS.

## Production Approach

Available short term survey data are used to compile quarterly output estimates, like monthly industrial production index and quarterly short term turnover statistics for certain services industries (Wholesale, and retail trade, food and accommodation services, transport and other services). Short term public finance statistics are used for the calculation of output in the government sector. Data from other sources, such as Bank of Greece, Association of Insurance Enterprises, etc are also used. Value added is derived from output figures on a quarterly basis by using input/output ratios. Taxes and subsidies are provided from STPFS.

## Greenland

### Source

The preparation of the annual National Accounts statistics in Greenland is undertaken by Statistics Greenland, located in Nuuk. Data are published once a year, typically by the end of November, and are made available on the internet ([www.bank.stat.gl](http://www.bank.stat.gl)) with the names of the variables appearing in Greenlandic, Danish and English. Data are followed by a short press-release and a publication containing more details, both available in Greenlandic and Danish. Longer time series are shown together with comments in Statistical Yearbook (text in Greenlandic and Danish).

### General

The present national accounts statistics for Greenland are based on 1993 SNA. The calculations are the first results from the new production based Greenlandic National Accounts statistics. Statistics for the General Government sector are quite detailed and it is possible to establish almost all accounts, i.e. from the production accounts to the capital account, for this sector. The statistics for the General Government sector are revised every ten years, most recently in 2011. The general government is quite important in Greenland and total expenditure for this sector accounts for approximately 70 per cent of GDP. Data are reported in current prices. Gross National Income is also calculated in constant prices.

<sup>a</sup> Data in this table have not been updated, resulting in discrepancies with equivalent items in other tables. Discrepancy with equivalent item in other tables.

<sup>b</sup> Discrepancy with equivalent item in Table 3.2 (Individual consumption expenditure of households, NPISHs, and general government at current prices).

<sup>c</sup> Data in this table have not been updated, resulting in discrepancies with equivalent items in other tables.

<sup>d</sup> Item does not consider consumption of fixed capital.

## Grenada

### Source

Official estimates are published by the Central Statistical Office, Ministry of Finance, in "National Income Estimates of Grenada," St. George's.

### General

The estimates shown in the following tables have been prepared in accordance with the United Nations System of National Accounts 1993 (1993 SNA) so far as the existing data would permit. When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in the SNA, a footnote provides explanation.

The base year for the constant price data is 2006.

## Guam

### Source

Response to the United Nations National Accounts Questionnaire from the Bureau of Statistics and Plans, Adelup, Guam. Official estimates and descriptions of Guam's Gross Domestic Product are prepared and published by the U.S. Bureau of Economic Analysis, U.S. Department of Commerce.

### General

The estimates shown in the following tables have been prepared in accordance with the United Nations System of National Accounts 1993 (1993 SNA) so far as the existing data would permit. When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in the SNA, a footnote provides explanation.

For further information, please visit <https://www.bea.gov/news/2021/gross-domestic-product-guam-2019>

### Methodology:

#### Overview of GDP Compilation

Comprehensive updates are typically performed every 5 years, based on the Census Bureau's every-5-years economic censuses of island areas. With the comprehensive update, estimates dating back to 2002 have been revised to incorporate improvements to source data and methods, including information from:

- The U.S. Census Bureau's 2017 Economic Census of Island Areas (ECIA), which provides the most thorough and detailed statistics on the structure of the Guam economy,
- County Business Patterns data for 2017 and 2018 from the U.S. Census Bureau,
- Hospital cost reports data from the Centers for Medicare and Medicaid Services (CMS),
- BEA's U.S. national income and product accounts, and
- Guam government data sources, such as building permit data and newly available fiscal year 2019 audited government financial statements.

The revisions to consumer spending primarily reflect the incorporation of an improved estimation method for health care services for all years. Previously, estimates for health care services provided to households, including by hospitals, were benchmarked every 5 years to ECIA data on total revenues. Now, services provided by the government hospital are estimated for all years using annual data on net patient revenues from financial statements. For 2015 forward, CMS cost report data on net patient revenues of private sector hospitals are used for the first time. The cost report data replaced estimates of private sector services that had been extrapolated based on payroll data. The effect of the updated estimation method on the growth of GDP was largest for 2015 forward, as the newly incorporated CMS data showed a different pattern of growth than payroll data.

Estimates of private fixed investment were also revised, primarily reflecting the incorporation of more detailed building permit data into the annual indicators for construction activity for 2013 forward.

The reference year for inflation-adjusted measures has been updated to 2012. This is the same reference year used in BEA's national GDP estimates.

The estimates of GDP by industry and compensation by industry have been updated to incorporate the above data sources.

## Guatemala

### Source

The Bank of Guatemala, through the Department of Economic Statistics and the National Accounts Section, is responsible for the compilation of official statistics for national accounts. For annual accounts, the Bank of Guatemala issues a summary of the statistical tables of the national accounts. These tables can be found online at <https://www.banguat.gob.gt/inc/main.asp?id=147392&aud=1&lang=1>.

### General

Prior to 2006, the calculations of the main variables in the national accounts were based on the methodology contained in the 1953 version of the national accounts handbook, revision 2; these variables were based on the production structure of 1958. While that methodology was useful for illustrating economic trends, its capacity to reflect the current state of the economy was limited in some respects.

To ensure that the calculations reflect the country's current production structure, since 1997 the Bank of Guatemala has been making efforts to compile the national accounts in accordance with the internationally recommended System of National Accounts 1993 (1993 SNA), with 2001 as the base year.

With the aim of keeping Guatemala's national accounts system updated, the Bank of Guatemala included in its Institutional Strategic Plan the project called "Cambio de Año de Referencia del Sistema de Cuentas Nacionales y Adopción del SCN 2008" which not only allowed the updating of the reference year to 2013, replacing 2001, but also the adoption of the latest version of the international manual of national accounts called the System of National Accounts 2008 (2008 SNA), which replaced the 1993 SNA.

### Methodology:

#### Overview of GDP Compilation

GDP is calculated using the production, expenditure and income approach. Each method of the calculation produces different analytical tools.

In the expenditure approach, GDP is equal to final consumption spending plus gross fixed capital formation plus changes in inventories plus exports, minus imports. This calculation produces the final demand for goods and services, the structure of which, compared to the 2001 reference year, does not show significant differences. This approach is also calculated in current values and in chain measures of volume with reference year 2013.

In the income approach, GDP is equal to compensation of employees plus taxes, less subsidies, on production and imports, plus operating surplus and mixed income. Although this approach is the least commonly applied, it is very useful for observing the distribution of income; however, it is calculated only in current values.

In the production approach, the GDP is equal to the sum of the aggregate gross values (calculated in current values and in chain measures of volume with reference year 2013) of all economic activities, calculated as the difference between production and intermediate consumption, plus taxes net of subsidies to products not included in the value of production. It should be noted that in this update the Financial Intermediation Services Indirectly Measured (FISIM) are distributed to their corresponding uses, unlike the 2001 reference year series.

#### Expenditure Approach

The final consumption expenditure of households, according to the 2008 SNA, is the monetary value paid in goods and services by resident households, whose purpose is to generate a direct satisfaction of the needs of the members of the household. This includes spending on goods and services, as well as the estimated value of barter transactions, goods and services received in kind, as well as goods and services produced and consumed within the same household.

The main sources of information used to calculate the final consumption expenditure of households are the National Survey of Family Income and Expenses (ENIGFAM) 2009-2010, the Living Conditions Surveys (ENCOVI) 2011 and 2014, the monthly report of the Consumer Price Index (CPI) and population projections. Secondly, information from administrative records from the financial sector and information from government units is used.

The main sources of information used for the calculation of the final consumption of the general government, as well as for the calculation of the production of the Public Administration and defense, focus on the budgetary executions of income and expenses, the financial statements with their respective notes, explanatory and the execution of payrolls and number of employees.

The measurement of the final consumption of the general government at current prices is made by means of the sum of the expenses in goods of common and non-common use, remuneration, and current or capital transfers. From this estimate, the sales of goods and / or services made by some public institutions at non-market prices are deducted.

Gross fixed capital formation measures the total value of acquisitions less disposals of fixed assets made by the producer during the accounting period, plus certain specific expenses in services that increase the value of non-produced assets.

The main sources of information are the importation of capital goods and the Quarterly Survey of the Advancement of Private Buildings.

The calculation methodology is presented in three subgroups, which group Guatemala's main gross fixed capital formation assets: construction, machinery and equipment, and cultivated assets.

Exports and imports of goods and services are measured on the basis of balance of payments information and foreign trade statistics. In this sense, the foreign trade statistics are published on the basis of electronic contracts data transmitted by the Superintendence of Tax Administration. These statistics can be used to classify general foreign trade in trade in the customs territory, trade covered by Decree No. 29-89 of the Congress of the Republic (Law for the Promotion and Development of Export and Maquila Activity) and the commerce covered by Decree No. 65-89 of the Congress of the Republic (National Law of Free Trade Zones).

## **Income Approach**

The factors of production are the resources that are used for the production of goods and services, which, as compensation, correspond to an income as payment. Within the framework of the National Accounts, these incomes are divided into three groups, these being remunerations to employees, which are made up of the income obtained from the provision of the labor factor; the gross operating surplus, which is the income from the capital factor; and mixed income, which is the combination of both income (capital and labor) that corresponds exclusively to the institutional sector of the Households.

Remunerations and mixed income are obtained directly from the Employment and Income Matrix (MEI), since it integrates in an analytical table the income information of wage earners and independent workers. This matrix is constructed from household surveys and is complemented with income information from other sources. For more details, consult the MEI methodology at the following route  
[https://www.banguat.gob.gt/cuentasnac/PIB2013/Matriz\\_de\\_empleo\\_e\\_ingresos.pdf](https://www.banguat.gob.gt/cuentasnac/PIB2013/Matriz_de_empleo_e_ingresos.pdf).

On the other hand, the information on the gross operating surplus is obtained through the Economic Entries.

The MEI makes it possible to harmonize the jobs (PT), the income generation account and the production account. Due to this, a consistency process is carried out to the aforementioned accounts, starting with the production variables and added value through indicators that relate, for example, the gross production per job position (P1 / PT) or the added value per job position (B1b / PT).

Additionally, an analysis of the compensation of employees is carried out by means of indicators prepared from the average wages and salaries in money and the jobs (D111 / PT), and the average salaries and wages in kind between the positions of work (D112 / PT). It should be noted that a special consistency is made for employers' social contributions, based on the regulations that concern social security in Guatemala.

Since the operating surplus and the mixed income are balances generated by the transactions of the variables mentioned in the previous paragraphs, the consistency of these transactions is first carried out to make a correct analysis on said balances. In the case of mixed income, the information presented by the MEI is used to obtain indicators such as the average mixed income between jobs (B3b / PT). On the other hand, for gross operating surplus, indicators of this variable are used, for example, operating surplus versus production (B2b / P11) and operating surplus versus value added (B2b / B1b).

## Production Approach

The basic information used to prepare the production account of the various economic activities consists of the financial statements of the companies, compiled through economic surveys conducted by the Bank of Guatemala and obtained directly from public corporations, the general government, and financial institutions that provided analytical records supplemented by statistical annexes, together with explanatory notes in some cases. Additionally, technical visits and complementary investigations are carried out to capture important information for measuring the production account of various economic activities.

The detailed methodology for each division of the ISIC can be found in the following link:

[https://www.banguat.gob.gt/cuentasnac/PIB2013/Cuentas\\_nacionales\\_de\\_Guatemala\\_aspectos\\_conceptuales\\_metodologicos.pdf](https://www.banguat.gob.gt/cuentasnac/PIB2013/Cuentas_nacionales_de_Guatemala_aspectos_conceptuales_metodologicos.pdf).

## Overview of the Compilation of the Integrated Economic Accounts

### Non-financial corporations (S11)

The non-financial corporations sector is subdivided into public non-financial corporations (S11001) and private non-financial corporations (S11002 / 3/4). The basic information used to prepare these are the financial statements of the companies, compiled in the case of public non-financial companies, through the Integrated Accounting System for Decentralized Institutions (SICOINDES), for these institutions their budget executions of income and expenses are also used, as well as information provided directly by said institutions (audited financial statements with explanatory notes).

Information on private non-financial corporations is obtained through the Economic Survey (ENEC) conducted by the Basic Statistics and Surveys Section of the Macroeconomic Statistics Department. Information was taken from the income statement to calculate from the production account to the secondary income distribution account. The production of non-financial corporations producing goods was calculated using the sales method, in which production consists of the sum of all sales during the period, other uses of production (transfers, remuneration in kind and donations) and changes in inventories of finished products and products in process. The production of non-financial companies engaged in trade was calculated by measuring trade margins; that is, the value of sales minus the cost of sales, which must be reconciled with the trade margins calculated by product in supply and use balances. To carry out this harmonization, a study of margins and marketing channels and freight rates was carried out, from which the different marketing channels and margin coefficients were obtained that are applied to the basic values of the different goods to obtain the margin valuation of trade by product and of the economy in general. For the set of units dedicated to providing services, production equals sales revenue.

Regarding accumulation accounts and balance sheet accounts (initial balance, change in balances and final balance), information was obtained from the general balance through the Economic Survey (ENEC), which shows financial and non-financial assets and liabilities of a company at a given time. Therefore, the accounts compiled on the basis of these balance sheets measure the flows or movements during the year, as well as the balances of said assets and liabilities. Additionally, the administrative records corresponding to the institutional subsector of private non-financial corporations are used as a source of auxiliary information, with the purpose of

complementing and validating the information of the institutional accounts. In this context, information from counterpart sectors with more information is also validated, such as the general government, financial companies, and the rest of the world account.

#### Financial corporations (S12)

Financial corporations are divided into six subsectors: central bank and depository corporations (S121 - S122), investment funds (S123 - S124), other financial intermediaries n.e.c. (S125), financial auxiliaries (S126), captive financial institutions and money lenders (S127) and insurance companies and pension funds (S128 - S129). It should be noted that for compilation purposes, these six subsectors have a greater disaggregation. The main sources of information to compile the accounts of financial companies are the financial statements of the institutional units that make up this sector, which are provided by the Superintendency of Banks (SIB) for the institutions under its supervision, as well as the audited financial statements that are obtained through the web pages of each financial institution. The information on the institutions not supervised by the SIB is obtained from the financial statements provided by them and through the Economic Survey (ENEC), as the case may be. The main production of financial companies is made up of the commissions charged explicitly and by the Financial Intermediation Services Indirectly Measured (FISIM), the latter are an estimate of the implicit charge made by financial institutions (intermediaries) for the intermediation service (granting loans and receiving deposits, among others), as well as lenders with their own funds. The explicit commissions are obtained directly from the financial statements and other information such as the explanatory notes to the financial statements. In the case of the central bank, its production is calculated through the sum of its costs and its production is treated as non-market. For its part, the FISIM calculation is carried out by allocating market benchmark interest and is calculated as the difference between the benchmark interest and the actual interest paid or collected. FISIM is used for intermediate consumption in economic activities, final consumption by households and exports. The intermediate consumption of financial companies takes into account the expenditure on goods and services used in the production processes, such as commissions, rental of buildings, electricity, communication expenses, etc. Value added is the difference between the gross value of production and intermediate consumption; and its components are determined by the information provided by the institutions. The balance obtained is the gross operating surplus. Property income receivable and payable, consisting of interest and dividends, can be calculated directly from the accounting and financial information obtained for this sector.

In the case of insurance companies, the production account reflects the production of non-life insurance that is calculated through the gross premiums received minus the adjusted indemnities plus the supplementary premiums, which consist of the return on investment of technical reserves. The value of the gross premiums is calculated as the value of the premiums received by the insurers (amount paid by the insured), deducting the value of their cancellations and refunds. Adjusted indemnities are calculated through the loss ratio, which corresponds to the percentage of the premium that the insurer expects to pay for claims that may occur in the period of validity, by type of claim. Insurance entities carry out reinsurance with other non-resident insurance entities, being the only entities that are legally authorized to do so. Reinsurance is measured in the same way as the insurance service in the local market, with the differentiation of the loss ratio that is calculated from the expected loss ratio only for imported and exported reinsurance. The production of life insurance is calculated through the premiums received, less the benefits accrued (when there is a death), plus the supplementary premiums that correspond to the property income generated (interest, dividends, among others) by the insurers by investing your reserves; plus the net changes in technical reserves. Income from secondary activities such as commissions and rentals, among others, is added to production.

The auxiliary financial activities of financial services include the provision of services that, without constituting financial services themselves, are closely linked to financial services activities, such is the case of credit card operators, brokerage houses, exchange, brokers and insurance adjusters, among others.

Gross formation of fixed capital, which includes acquisitions of durable goods and intangible investments, is calculated on the basis of movements in fixed assets and accounting flows, deducting the revaluation effect. Gross savings in this sector are obtained as residual. This procedure is used to reconcile non-financial and financial transactions in the financial statements and to ensure consistency of net loans. Changes in inventories include inventories of silver, gold and / or other precious metals, as well as merchandise inventories. They are measured taking into account the movements in the accounting flows. After compiling the financial account based on the

financial assets and liabilities identified in the balance sheet, the net borrowings (+) / net borrowings (-) from the financial account are compared to the net borrowings / net borrowings from the financial account. capital. In principle, the two values should be the same; in practice, they are not due to the lack of information in the basic data.

The information to calculate the balance sheet accounts (opening balances, balance changes and closing balance), is obtained from the general balance sheet and from the explanatory notes to the audited financial statements, which record the assets (financial and non-financial) and liabilities held by financial institutions at the beginning and end of the year under study, which allows determining the flow or movement of the year, as well as the stocks of said items.

#### General Government (S13)

This sector is divided into five subsectors: central government except social security and ISFLSGC (S13111), non-profit institutions that serve the central government, ISFLSGC, (S13112), local governments (S13131), non-profit institutions that serve local governments, ISFLSGL (S13132) and social security funds (S1314). The main sources of information to compile the accounts of the general government are the budgetary executions of income and expenses, as well as the financial statements of the institutional units that make up this sector, which are provided by the Ministry of Public Finance through the different modules of the Integrated Accounting System (SICOIN, SICONIDES and SICOINGL), as well as audited financial statements, provided directly by the institutions. The data from budget runs is used to calculate transactions because the details they contain allow you to distinguish the various transactions posted to different accounts. Furthermore, as this information is available at the level of the entities and organizations identified as budget units, it can be used to make the necessary classifications according to the economic activity and the function performed by these units when they participate in certain transactions. It should be noted that the expenses mentioned in the budget execution data are recorded on a cash basis, so they have been adjusted as necessary and with the complementary information available, to convert them on an accrual basis. The complete sequence of accounts is compiled, from production accounts to balance sheets. The particular characteristics of the accounts in this sector are highlighted below. Government institutional units may have market production, production for their own final use, and other non-market production. Total production is calculated using explicit costs incurred; In other words, by calculating the sum of intermediate consumption, employee compensation, other taxes on production and consumption of fixed capital, it should be noted that there is no information on consumption of fixed capital, so the data from depreciation as a proxy for this item. Other non-market production for own use is obtained by deducting from the total production calculated on a cost basis the value of sales of goods and services at economically significant prices (market production) and sales of goods and services at prices that are not they are economically significant. The operating surplus of the market activities of the institutions of the general government, which is recorded in the income generation account, is equal to the production of such activities less the sum of the costs incurred; that is, it is calculated as an equilibrium element, as in the case of any market activity.

Taxes on production and imports are measured using data on tax revenues and own revenues received by certain institutional units, such as the Guatemalan Tourism Institute, the National Institute of Technology and Training, and the Superintendency of Tax Administration. The criteria for recording current taxes on income, wealth, etc., are similar to those applied to taxes on production and imports. All current transfers made by the government to public non-financial corporations and other private corporations are recorded as subsidies, which are reflected in the data on budget execution and financial statements, as the case may be. Property income transactions cover, mainly, the interests paid on the internal and external public debt and on the securities issued, which are harmonized, in the process of reconciliation of the interest matrix, with the interests received by the banks. and the rest of the world. Property rental income mainly includes dividends and withdrawal of income from quasi-corporations from nonfinancial and financial public corporations, as well as interest on deposits and securities acquired from third parties. Includes payments from the private sector to the government for the use of state-owned resources, such as mining royalties. The net social contributions include the income of the Guatemalan Social Security Institute (IGSS) and the Military Welfare Institute (IPM) for the contributions they receive from employees and employers in exchange for the provision of social security benefits to participants. The calculation of social security benefits includes data on pension and retirement benefits, temporary disability benefits, lump sum benefits for permanent disability, special rehabilitation benefits, and disability, old age and survivors benefits, among others. Employee benefit payments that do not come from special funds (which at the same time are considered imputed social

contributions) refer to social assistance benefits paid in the form of pensions, directly by the government as the employer of its former employees, ex disabled employees, etc. make these payments without creating a segregated reserve or other special fund for that purpose. To measure other current transfers payable, the data reported by each institutional unit is recorded, first separating current transfers within the general government from transfers paid to other sectors; the latter are reconciled with the values that these sectors report having received in the process of preparing the current transfer matrices. For other current transfers receivable, internal and external transfers recorded as government revenue are measured. The final consumption expenditure of the general government in individual and collective consumption consists of other non-market production for own final use, calculated in the production account. In the compilation of general government accounts, individual final consumption expenditure is considered to include expenditures directed at a limited group of people, as in the case of education, health, sports and recreation. Collective final consumption expenditure was considered to include all services provided by the government to the community as a whole, such as public administration and defense. Individual final consumption expenditure also includes purchases of goods and services by the general government that are distributed to households without any processing, such as medicines provided free of charge. The value of individual final consumption expenditure, recorded using the use of disposable income account, is transferred to households in the form of social transfers in kind. This transaction is recorded in the redistribution of income in kind account.

For the calculation of gross fixed capital formation in construction and machinery and equipment, data from the balance sheet are used after being reconciled with budget executions, in cases where data from both sources were available. Capital transfers receivable are calculated from the balance sheet equity, where it cannot be identified, it is taken from the income of budget executions, as well as transfers payable from the expense values shown in said executions. Like current transfers, capital transfers are reconciled with the values reported as received and paid by those sectors in the process of preparing the capital transfer matrices. In both cases, internal transfers (between subsectors of the general government) are distinguished from transfers receivable and payable to other sectors. The accumulation and balance sheet accounts are compiled on the basis of data from the general balance sheet, identifying transactions that involve financial and non-financial assets; and liabilities, and incorporating the adjustments obtained in the harmonization process of the transaction matrices, other flows and balances.

#### Households (S14)

The 2008 SNA manual defines the household as a small group of people who share the same home, their income and wealth (totally or partially), and who collectively consume certain types of goods and services, especially those related to food and accommodation. In addition, institutional households composed of people residing in hospitals, nursing homes, convents, prisons for long periods of time, etc. are listed. The institutional sector of households is made up of all resident households that function as producers, income earners, consumers and owners of assets and liabilities. In this context, households as producers are delimited within an operational framework called household enterprises, the legal organization of which is unincorporated enterprises. Its main characteristics include the lack of clear distinction between assets and liabilities belonging to the company and those of its holders as members of the household. These holders can be employers (if they have employees) or self-employed (if they have no employees). Household production recorded in the national accounts includes the production of all goods and services intended for sale, for self-consumption or self-training of capital, for own-account production of owner-occupied housing services, and household and personal services produced by paid staff. In addition, it is considered among the characteristics of the producer in the household sector, the classification of the institutional group into three subsectors, these being formal households, informal households and other households, depending on the size of the company and the destination of the company. production. In order, the added value of households is obtained from the Employment and Income Matrix (MEI), which presents the labor income of households by subsector and economic activity; cost structures, technical coefficients and production structures are estimated with information from the Economic Survey (ENEC) directed at household establishments, which was used to investigate household enterprises with fixed premises dedicated to manufacturing, commerce, services and transportation; in conjunction with some special investigations for other activities such as mining, construction, agriculture, financial auxiliaries and domestic services, where complementary sources of information are used.

The household account was processed at the institutional level from the production account to the balance sheet account, and at the same time the accounts of the economic activities in which households participate are compiled. This ensured coherence between institutional sectors and economic activities. When the institutional sectors use labor offered by households to carry out their production process, they are compensated through the payment of salaries and social contributions. Another important part of household income is found in the income they receive from owning financial assets in resident and non-resident units. Likewise, there are also rents received from the leasing of natural resources to other institutional sectors. As remunerated, the contributions paid and benefits received by households are recorded in the secondary distribution of income account. In addition, this account records the so-called current transfers, which constitute another type of income received by households. One of the most important transfers are those made between resident and non-resident households (remittances). The result of current transfers, contributions and social benefits is recorded as disposable income. In addition, it is considered as income in kind those transfers made to households in the form of goods and services, by the institutional sectors of the government and the non-profit institutions that serve households (NPISHs). When this transfer is added to disposable income, the adjusted disposable income is obtained, which is recorded as the balance of the income redistribution account in kind.

The acquisition and disposal of assets (financial and non-financial) and liabilities is another of the functions of households. Asset acquisitions reflect the accumulated wealth of households, which, for the most part, is the acquisition of homes (non-financial asset); this sector can also concentrate part of its wealth in investments in financial assets. As a counterpart, households have liabilities, among which are loans related to mortgages. These acquisitions and disposals of household assets and liabilities are recorded in the accumulation accounts and in the balance sheet accounts, most of which are compiled as a counterpart of their interaction with other sectors, thus sequentially showing the balances and the changes in the value of assets and liabilities owned by this institutional sector. The accounts mentioned are integrated for the first time into the national accounts of Guatemala.

#### Non-Profit Institutions Serving Households (NPISHs)

The information used to compile the current accounts of this sector was taken from the detailed financial statements of these institutions, which consist of the income statement and the general balance sheet, captured in the Economic Survey (ENEC). In principle, the complete sequence of accounts is compiled for the units that make up this sector, from production accounts to the balance sheet account; the particular characteristics of the accounts in this sector are highlighted below. Output is measured by costs incurred, that is, as the sum of intermediate consumption, compensation of employees, other taxes on production and consumption of fixed capital, as consumption of fixed capital was not estimated, data on depreciation is used as a proxy for this item. The other non-market production for own use is obtained by deducting from the total production calculated on a cost basis the value of the sales of goods and services at economically significant prices (market production) and the sales of goods and services at prices that do not they are economically significant. The operating surplus of the economic market activities of these institutions, which is recorded in the income generation account, is equal to the production of such activities less the sum of the costs incurred.

Property receivables consist primarily of interest earned on deposits and, to a lesser extent, some investments in securities. Most of the sector's resources come from current transfers to these institutions from various resident sectors and the rest of the world. These data are obtained from the financial statements of the institutions and from the reconciliation process of the transfer matrices, in which this sector is assigned the amounts paid by other sectors and the rest of the world. The individual final consumption expenditure of these institutions consists of other non-market production for own final use, calculated in the production account, plus purchases of goods and services by NPISHs that are distributed to households without any processing. The value of individual final consumption expenditure, recorded using the disposable income account, is transferred to households in the form of social transfers in kind (individual transfers of non-market goods and services). This transaction is recorded in the redistribution of income in kind account.

Regarding the accumulation accounts, the initial balances, the changes in the balances and the final balances, the information was obtained from the balance sheet provided in the ENEC, which records the assets (financial and non-financial) and liabilities in power of these institutions, allowing the accounts that are prepared from this financial statement, measure the flows and stocks of the year.

Additionally, the administrative records corresponding to this institutional sector are used as a source of auxiliary information, with the purpose of complementing and validating the information of the institutional accounts. In this context, the information of counterparty sectors with more information is also validated to complete the transactions of the NPISH sector, such as the general government, financial corporations, public non-financial corporations and the rest of the world account.
