## Guinea

### Source

Response to the United Nations national accounts questionnaire from the National Statistics Institute (Institut National de la Statistique - I.N.S), Ministry of Planning (Ministère du Plan), Conakry.

The National Institute of Statistics (NIS), the Department of National Accounts, completed National accounts 2012 and 2013 according to the 1993 System of National Accounts (1993 SNA) after the completion of the series of the economic accounts from 2006 to 2011.

### General

The estimates shown in the following tables have been prepared in accordance with the concepts and definitions of the System of National Accounts 1993 (1993 SNA). Previously the estimates were prepared in accordance with the United Nations Systems of National Accounts 1968 (1968 SNA). Footnotes indicate when the scope and coverage of the data differ from the definitions and classifications recommended in the 1993 SNA.

The chain constant price estimates are referenced to 2010.

### Methodology:

### Overview of GDP Compilation

The Gross domestic product is determined on three approaches, the production, the expenditure and income approach. The convergence of these three approaches helps ensure the consistency of data from various sources.

**Table 1.1 Gross domestic product by expenditures at current prices**

# Guinea-Bissau

## Source

Response to the United Nations national accounts questionnaire from the Ministerio do Plano, Bissau.

## General

The estimates shown in the following tables have been prepared in accordance with the United Nations System of National Accounts 1993 (1993 SNA) so far as the existing data would permit. When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in the SNA, a footnote provides explanation. As of 2 May 1997, Guinea-Bissau has adopted as the national currency the CFA franc following its membership in the West African Monetary Union and the Central Bank of West African States (BCEAO). The currency conversion between the Guinean peso and the CFA franc was set at the rate of PG 65 per CFA franc on the basis of the 31 December 1996 market rates.

## Guyana

### Source

Response to the United Nations national accounts questionnaire from the Statistical Bureau, Georgetown. Official estimates have been published by the Statistical Bureau in "Annual Statistical Abstract".

### General

The estimates shown in the following tables have been prepared in accordance with the United Nations System of National Accounts 2008 (2008 SNA) so far as the existing data would permit. When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in the SNA, a footnote provides explanation.

### Methodology:

#### Overview of GDP Compilation

In Guyana, GDP by industry is calculated using a mix of two approaches: the production approach and the income approach.

The main method used for compiling GDP in Guyana is the production approach in which estimates are compiled by industry at basic prices as the sum of the gross value added generated by resident producers. These estimates are moved to purchasers prices by adding taxes on products net of subsidies, trading margins, and subtracting non deductible V.A.T to the GDP at basic prices.

#### Expenditure Approach

GDP by expenditure is calculated using the residual approach to derive private consumption. It is produced in current prices and not deflated.

The GDP by expenditure method is equal to the sum of total consumption and total investment. Total investment is classified into public and private investment and data for these are sourced from estimates of the Public Sector Investment Programme (PSIP), information on foreign direct investment in the Balance of Payment, and administrative records of investment agencies. Total consumption is classified into final consumption expenditures of public administrations (Government) and private consumption / non-profit institutions serving households (NPISH).

Public consumption expenditures are derived from estimates of non-merchandise production, which is in turn calculated from various government sources. The main sources of this data are from central government employment cost, National Insurance Scheme employment cost, statutory bodies' employment cost and municipalities' employment cost.

Private consumption is a residual after estimating private investment, public investment, and public consumption, from total domestic final expenditure. This in turn is equal to total domestic final expenditure minus (private investment + public investment + public consumption).

Imports and exports of goods and services are obtained from Guyana Revenue Authority (Customs) for goods and Balance of Payments statistics for services. A conversion table is prepared to convert the foreign trade data submitted under the Harmonized Commodity Description and Coding System (HS) and the SITC to the corresponding national accounts product classification.

#### Production Approach

Using the production method, GDP is calculated at basic prices. Its value is obtained by calculating the sum of the gross value added in each industry valued at basic prices. To derive at gross value added, intermediate

consumption of each economic activity is subtracted from its value of output (gross output).

The primary data sources are:

- (a) the Monthly Production Survey; a survey where data is obtained on the value and volume of selected goods and services by type of economic activity in Guyana.
- (b) Annual Economic Survey.
- (c) Administrative records of various Governmental agencies.

# Haiti

## Source

Response to the United Nations national accounts questionnaire from the Institut Haitien de Statistique, Port-au-Prince. The official estimates are published by the Institut in "Le Bulletin de Statistique Supplement Annuel de l'Institut".

## General

The estimates shown in the following tables have been prepared in accordance with the United Nations System of National Accounts 2008 (2008 SNA) so far as the existing data would permit. When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in the SNA, a footnote provides explanation.

## Methodology:

## Overview of GDP Compilation

The Haitian Institute of Statistics and Informatics (IHSI) proceeded to change the base of National Accounts and took the opportunity to implement the latest System of National Accounts 2008 (SNA 2008).

The new basis determined for the National Accounts of Haiti is fiscal year 2012. This change of base was an opportunity, among other things, to review the concepts and methods of preparation of Accounts, improve data sources and update nomenclatures statistics.

The Department of Economic and Social Affairs of the United Nations is a vital interface between global policies in the economic, social and environmental spheres and national action. The Department works in three main interlinked areas: (i) it compiles, generates and analyses a wide range of economic, social and environmental data and information on which United Nations Member States draw to review common problems and to take stock of policy options; (ii) it facilitates the negotiations of Member States in many intergovernmental bodies on joint courses of action to address ongoing or emerging global challenges; and (iii) it advises interested Governments on the ways and means of translating policy frameworks developed in United Nations conferences and summits into programmes at the country level and, through technical assistance, helps build national capacities.

#### NOTE

Symbols of United Nations documents are composed of capital letters combined with figures. Mention of such a symbol indicates a reference to a United Nations document. The first 14 editions of the National Accounts Yearbook were issued without series symbols.

The designations employed and the presentation of the material in the present publication do not imply the expression of any opinion whatsoever on the part of the United Nations concerning the legal status of any country or of its authorities, or the delimitations of its frontiers. The term “country” as used in this report also refers, as appropriate, to territories or areas. The designations of country groups are intended solely for statistical or analytical convenience and do not necessarily express a judgement about the stage reached by a particular country, territory or area in the development process. Mention of the names of firms and commercial products does not imply endorsement by the United Nations. The symbols of United Nations documents are composed of capital letters and numbers.

# INTRODUCTION

1. This is the sixty-second issue of *National Accounts Statistics: Main Aggregates and Detailed Tables*<sup>1,2</sup> showing detailed national accounts estimates for 210 countries and areas for the reporting years 2009 to 2020. Like the previous issues, it has been prepared by the Statistics Division of the Department for Economic and Social Affairs of the United Nations Secretariat with the generous co-operation of national statistical offices. It is issued in accordance with the recommendation of the Statistical Commission at its first session<sup>3</sup> that the Statistics Division of the United Nations should publish regularly the most recent available data on national accounts for as many countries and areas as possible.

## THE NATIONAL ACCOUNTS QUESTIONNAIRE

2. This publication is the twenty-first issue based on the United Nations National Accounts Questionnaire (NAQ) introduced in October 1999, which in turn is based on *the System of National Accounts 1993 (1993 SNA)*<sup>4</sup>.

3. The 1993 SNA was unanimously recommended to the United Nations Economic and Social Council by its Statistical Commission at its 24th session in March 1993. Similar to the recommendation made in 1968 for its predecessor, *A System of National Accounts* (1968 SNA)<sup>5</sup>, the Council in its resolution 1993/5 of 12 July 1993 recommends that Member States use the 1993 SNA in the international reporting of comparable national accounting data. However, it should be highlighted that the Council went a few steps further in 1993 and also recommends that Member States consider using the 1993 SNA: (a) as the standard for the compilation of their national accounts statistics, (b) to promote the integration of economic and related statistics, and (c) as an analytical tool. In 2003 the United Nations Statistical Commission (UNSC) called for an update of the 1993 SNA. The updated SNA, called *The System of National Accounts 2008*<sup>6</sup>, or in short, the 2008 SNA, was finalized during 2009. Beginning in October 2014, Member States of the European Union adopted the European System of Accounts 2010 (ESA 2010)<sup>7</sup>, which is a counterpart of the 2008 SNA. In addition to the European Union Member States, an increasing number of other countries have also adopted the 2008 SNA recommendations.

4. Taking into account all the above recommendations the United Nations Statistics Division (UNSD), in cooperation with the United Nations Regional Commissions, has designed the United Nations National Accounts Questionnaire (NAQ) based with the following objectives in mind:

(a) The tables included are those that provide a data set most relevant for global and regional analysis carried out by the United Nations Department of Economic and Social Affairs (DESA) and other international and regional organizations. It should be noted that the scope of the 1993 SNA aims at a much more detailed analysis at the national level than what the questionnaire tables represent. The UNSC has agreed that the scope and pace of the implementation of the 1993 SNA must be decided by each country according to its analytical and policy needs, the resources available for implementation, and the current state of basic data.

(b) The tables reflect an equally balanced emphasis between production analysis based on supply and use information by industries on the one hand, and production, income and financial analysis based on integrated accounts for institutional sectors on the other. Thus, the behaviour of economic agents and distributional effects which are very important in explaining differences in economic structures and developments of countries can be identified.

## SCOPE OF THE QUESTIONNAIRE

5. The data tables of the questionnaire are divided into five parts. Part I (Tables 1.1 to 1.3) requests summary information on gross domestic product by expenditure in current and constant prices and on the relations among product, income, saving and net lending aggregates.

6. Part II (Tables 2.1 to 2.6) of the questionnaire requests information on kind of activity breakdowns. The data series for this group of tables are requested to be reported according to the International Standard Industrial Classification of all Economic Activities (ISIC<sup>8,9</sup>). Tables 2.1 to 2.3 follow the ISIC Rev. 3 and are equivalent to Tables 2.4 to 2.6, which follow the ISIC Rev. 4, and countries can complete the appropriate tables according to the ISIC version they use for compiling their national accounts. Data can be provided either as a combination of tabulation categories (A+B, G+H, J+K and M+N+O, for the ISIC Rev. 3; or A, B+C+D+E, C, F, G+H+I, J, K, L, M+N, O+P+Q and R+S+T, for the ISIC Rev. 4) or as single tabulation categories (Sections A to P for ISIC Rev. 3; and A to T, for ISIC Rev. 4) (one-digit level of ISIC). In the case of ISIC Section A, information at the two-digit level is requested for divisions 01, 02 (and 03, for the ISIC Rev. 4); whereas for ISIC Rev. 3 Section I information is requested for division 64 and the sum of the divisions 60 to 63. Where appropriate both current and constant prices are specified.

7. Part III (Tables 3.1 and 3.2) of the questionnaire requests information on functional breakdowns in current prices. The data series are requested to be reported according

to the Classifications of Expenditure According to Purpose<sup>10</sup>. For the general government final consumption expenditure (including both individual and collective consumption expenditure), data are requested for the 10 divisions of the Classification of the Functions of Government (COFOG). For the individual consumption expenditure by households, data are requested for the first 12 divisions of the Classification of Individual Consumption According to Purpose (COICOP), which is based on the Central Product Classification (CPC)<sup>11,12</sup>. For the individual consumption expenditure by non-profit institutions serving households, data are requested for groups 13.1 through 13.6 of division 13 of COICOP. For the individual consumption expenditure by general government, data are requested for groups 14.1 through 14.5 of division 14 of COICOP.

8. Part IV (Tables 4.1 to 4.9) of the questionnaire requests information on the integrated economic accounts. The data requested in this part includes the sequence of accounts for the total economy, rest of the world and the five institutional sectors of the system, i.e., the non-financial corporations, financial corporations, general government, households, and non-profit institutions serving households. For all of the sectors as well as for the total economy data for the uses and resources as well as balancing items are requested for each of the accounts from the production account through the financial account as specified in Annex V, Part II of the 1993 SNA.

9. Part V (Tables 5.1 and 5.2) of the questionnaire requests information on the cross-classification of gross value added by industries and institutional sectors. Data are requested to be reported for gross value added of the total economy and the five institutional sectors of the system included in Part IV cross-classified by categories of ISIC Rev. 3 (Table 5.1) or ISIC Rev. 4 (Table 5.2) as indicated in Part II above.

10. Countries are requested to update the data tables and complete them as comprehensively as possible. The tables are listed below:

#### Part I: Main aggregates

Table 1.1 Gross domestic product by expenditures at current prices

Table 1.2 Gross domestic product by expenditures at constant prices

Table 1.3 Relations among product, income, saving and net lending aggregates at current prices

#### Part II: Domestic production by industries

Table 2.1 Value added by industries at current prices (ISIC Rev. 3)

Table 2.2 Value added by industries at constant prices (ISIC Rev. 3)

Table 2.3 Output, gross value added and fixed assets by industries at current prices (ISIC Rev. 3)

Table 2.4 Value added by industries at current prices (ISIC Rev. 4)

Table 2.5 Value added by industries at constant prices (ISIC Rev. 4)

Table 2.6 Output, gross value added and fixed assets by industries at current prices (ISIC Rev. 4)

#### Part III: Classifications of expenditure according to purpose

Table 3.1 General government final consumption expenditure by function at current prices

Table 3.2 Individual consumption expenditures at current prices

#### Part IV: Integrated economic accounts

Table 4.1 Total economy (S.1)

Table 4.2 Rest of the world (S.2)

Table 4.3 Non-financial corporations (S.11)

Table 4.4 Financial corporations (S.12)

Table 4.5 General government (S.13)

Table 4.6 Households (S.14)

Table 4.7 Non-profit institutions serving households (S.15)

Table 4.8 Combined Sectors: Non-Financial and Financial Corporations (S.11 + S.12)

Table 4.9 Combined Sectors: Households and NPISH (S.14 + S.15)

#### Part V: Cross classification of gross value added by industries and institutional sectors

Table 5.1 Cross classification of gross value added by industries and institutional sectors (ISIC Rev. 3)

Table 5.2 Cross classification of gross value added by industries and institutional sectors (ISIC Rev. 4)

11. It should be noted that the NAQ does not cover the full scope of the accounts and tables that comprise the 1993 SNA since it mainly serves to collect data needed for global and regional analysis rather than national analysis. Also, it is in certain respects less comprehensive than the previous questionnaire based on the 1968 SNA since, for example, it does not include tables for the other changes in assets accounts and the balance sheets of the total economy and institutional sectors; the data requested on stocks of fixed assets is very limited; the tables requested broken down by kind of economic activity are less detailed, showing mainly the one-digit level of ISIC instead of the two-digit level of ISIC.

## COLLECTION OF DATA

12. To collect the large volume of national accounts data, the Statistics Division annually sends a pre-filled NAQ to countries or areas. The recipients are requested to update the questionnaire with the latest available national accounts estimates and to indicate where the scope and coverage of the country estimates differ for conceptual or statistical reasons from the definitions and classifications recommended by the 1993 SNA. Data obtained from these replies are supplemented by information gathered from correspondence with the national statistical offices and from national source publications. Countries are also requested to provide a brief overview of the sources and methods to compile their national accounts.

13. In order to lighten the reporting burden of countries to different international and regional organizations the UNSD receives data from the Organisation for Economic Co-operation and Development (OECD), the United Nations Economic Commission for Europe (ECE) and the Caribbean Community (CARICOM) on behalf of their constituents. The UNSD, Eurostat and the OECD have agreed on an integrated set of national accounts questionnaires. The three organizations exchange data to a maximum extent possible. Thanks to the consistency of the 1993 SNA and the European System of Accounts (ESA 1995), and also the consistency between the 2008 SNA and the ESA 2010, all OECD countries submit data either to EUROSTAT or OECD but need not provide duplicate submissions. Member States of OECD which are not members of the European Community complete a OECD-specific questionnaire. The ECE provides data for its non-European Member States. CARICOM uses the NAQ to collect data from its Member States and provides it to UNSD. As a result, the United Nations questionnaire based on the 1993 SNA is sent to less than 160 countries, areas, and territories out of the 235 (of which only 210 have provided sufficient data to be published) included in the UNSD National Accounts database.

14. In order to create a comprehensive database based on the 1993 SNA, UNSD made a one-time conversion of data from the 1968 SNA format to the 1993 SNA format for all countries included in the UNSD national accounts database.

## CONCEPTUAL REFERENCES AND PRESENTATION OF DATA

15. The form and concepts of the statistical tables in the present publication generally conform to the recommendations by the 1993 SNA. A summary of the conceptual framework and definitions of transactions is provided in chapter I of the present publication.

16. Although the NAQ collects data in the 1993 SNA format, countries may still use the 1968 SNA (or in some rare cases the 1953 SNA) guidelines to compile their national accounts. The UNSD evaluates the status of the conceptual adherence to the 1993 SNA from time to time.

17. The Series number at the top of each table indicates which SNA version is used by the given country to compile their national accounts. Series numbers below 100 relate to data according to the 1968 SNA, series numbers 100 and above relate to data according to the 1993 SNA and series numbers 1000 and above relate to data according to the 2008 SNA. Whenever data based on a previous version of the SNA are not replaced backwards for all years by a series of data based on a newer version of the SNA, the newer data are presented in a new row with one overlapping year in order to allow users to link the two series. When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended by the 1993 SNA, a footnote is attached to the relevant tables.

18. In the tables with constant price data (Tables 1.2, 2.2 and 2.5), the data with a new fixed base year are presented as a new sub-series in a separate row with one overlapping year. The new base year (or reference year) is indicated in the column of the year in which the new sub-series starts. An exception to this rule is chain linked volume series where figures are given at prices of the previous year. Such data are presented as a single series and the respective base year is indicated for every year. For countries, which use chain linked volume series but link the data to a uniform reference year, a respective qualification is made in the country note. It has to be noted that constant price data, which are linked or chained in such a way are not additive, i.e., the total is not equivalent to the sum of its components.

19. In the present publication, the data for each country or area are presented in separate chapters, in alphabetical order, under uniform table headings and classifications of the 1993 SNA. Unless otherwise stated, the data in the country tables relate to the calendar year against which they are shown. The Series note at the top of each table indicates the type of fiscal year used for any given series.

## COMPARABILITY OF THE NATIONAL ESTIMATES

20. Every effort has been made to present the estimates of the various countries or areas in a form designed to facilitate international comparability. To this end, important differences in concept, scope, coverage and classification have been described in the notes, which precede and accompany the country tables. Such differences should be taken into account if misleading comparison among countries or areas are to be avoided. It should also be noted

that the country notes not only refer to the latest data covered in this publication but to the country in general.

## REVISIONS

21. The figures shown are the most recent estimates and revisions available at the time of compilation. In general, figures for the most recent year are to be regarded as provisional.

## NOMENCLATURE

22. The information for the countries and areas shown in this publication reflect what is available to the UNSD as of August 2021. Updated national accounts data are usually provided by countries to the UNSD between January and July. Data for the year 2020 are currently available for 119 countries and areas.

23. The data for the countries listed below are represented as follows:

China is published in this yearbook in three sections: China; China, Hong Kong Special Administrative Region; and China, Macao Special Administrative Region. The data for China exclude the special administrative regions of Hong Kong and Macao.

Netherlands Antilles – The Netherlands Antilles as a country was dissolved on 10 October 2010. As of this date, Curaçao and Sint Maarten became countries within the Kingdom of the Netherlands, and the islands Bonaire, Saint Eustatius and Saba became special municipalities of the Netherlands. Data up to 2009 that appear under Netherlands Antilles refer to the former country. Data for Curaçao and Sint Maarten appear separately under the respective country names and data for Bonaire, Saint Eustatius and Saba appear under the collective name and represent data for these special municipalities of the Netherlands.

Sudan and South Sudan – South Sudan seceded from Sudan in July 2011. Data for the former Sudan appear under “Sudan (up to 2011)”. Data for Sudan and South Sudan in the new

configuration (after July 2011) appear under the respective country names.

Tanzania – The data for Tanzania are published in two parts in this yearbook: mainland Tanzania and Zanzibar. Note that the data listed under Tanzania does not include Zanzibar.

## SYMBOLS AND DATA DISPLAY

24. The following symbols have been employed:

Data not available..... [...]

Magnitude nil or less than five percent of the unit employed..... [0.0]

Decimal figures are always preceded by a point [.]

25. Each series version is presented in a separate row and identified by a series number in the column of the year in which it starts. A new series version is introduced if the data displayed differs from preceding data in terms of methodology, fiscal-year type or currency. A Series note at the top of each table informs about the SNA version applied, currency denomination, and fiscal-year type used. The scale used to present the data is displayed at the top right of each table.

26. Decimals in tables do not necessarily add to totals shown because of rounding.

## GENERAL DISCLAIMER

27. The designations employed and the presentation of material in this publication do not imply the expression of any opinion whatsoever on the part of the Secretariat of the United Nations concerning the legal status of any country, territory, city or area or of its authorities, or concerning the delimitation of its frontiers and boundaries.

28. Where the designation “country or area” appears in the headings of tables, it covers countries, territories, cities or areas. In prior issues of this publication where the designation “country” appears in the headings of tables, it covers countries, territories, cities or areas

# I. SYSTEM OF NATIONAL ACCOUNTS

1. The origins of the System of National Accounts (SNA) trace back to the 1947 Report of the Sub-Committee on National Income Statistics of the League of Nations Committee of Statistical Experts under the leadership of Richard Stone<sup>1</sup>. At its first session in 1947, the United Nations Statistical Commission emphasized the need for international statistical standards for the compilation and updating of comparable statistics in support of a large array of policy needs. Specifically, the Commission recommended that the United Nations Statistical Office, in consultation with the interested specialized agencies, should work on guidelines for national accounts statistics (national income and expenditure), taking into consideration best practices and international comparability<sup>2</sup>. In view of the emphasis on international statistical standards, the first national accounts standard was produced and published in 1953. The SNA was subsequently revised and updated in 1960, 1964, 1968 and 1993. In 2003 the Statistical Commission called for an update of the 1993 SNA. The System of National Accounts 2008<sup>3</sup>, (in short the 2008 SNA) was finalized in 2009. This chapter describes the concepts and definitions of the SNA as recommended by the 1993 SNA.

## A. THE SNA AS A SYSTEM

2. The System of National Accounts is a statistical framework that provides a coherent, consistent and integrated set of macroeconomic accounts, balance sheets and tables based on a set of internationally agreed concepts, definitions, classifications and accounting rules. It provides a comprehensive accounting framework within which economic data can be compiled and presented in a format that is designed for purposes of economic analysis, decision-taking and policy-making. The accounts themselves present in a condensed way a great mass of detailed information, organized according to economic principles and perceptions, about the working of an economy. They provide a comprehensive and detailed record of the complex economic activities taking place within an economy and of the interaction between the different economic agents, and groups of agents that takes place on markets or elsewhere. In practice the accounts are compiled for a succession of time periods, thus providing a continuing flow of information that is indispensable for the monitoring, analysis and evaluation of the performance of an economy over time. The SNA provides information not only about economic activities, but also about the levels of an economy's productive assets and the wealth of its inhabitants at particular points of time. Finally, the SNA includes an external account that displays the links between an economy and the rest of the world.

3. The SNA may be implemented at different levels of aggregation: at the level of individual economic agents, or institutional units as they are called in the System; for groups of such units, or institutional sectors; or at the level of the total economy. Although traditionally described as a system of national accounts, for analytical purposes the SNA has to be implemented at lower levels of aggregation. In order to understand the workings of the economy, it is essential to be able to observe and analyze the economic interactions taking place between the different sectors of the economy. Certain key aggregate statistics, such as gross domestic product (GDP), which are widely used as indicators of economic activity at the level of the total economy, are defined within the System, but the calculation of such aggregates has long ceased to be the primary purpose for compiling the accounts.

4. The System is built around a sequence of interconnected flow accounts linked to different types of economic activity taking place within a given period of time, together with balance sheets that record the values of the stocks of assets and liabilities held by institutional units or sectors at the beginning and end of the period. Each flow account relates to a particular kind of activity such as production, or the generation, distribution, redistribution or use of income. Each account is balanced by introducing a balancing item defined residually as the difference between the total resources and uses recorded on the two sides of the account. The balancing item from one account is carried forward as the first item in the following account, thereby making the sequence of accounts an articulated whole. The balancing items typically encapsulate the net result of the activities covered by the accounts in question and are therefore economic constructs of considerable interest and analytical significance - for example, value added, disposable income and saving. There is also a strong link between the flow accounts and the balance sheets, as all the changes occurring over time that affect the assets or liabilities held by institutional units or sectors are systematically recorded in one or another of the flow accounts. The closing balance sheet is fully determined by the opening balance sheet and the transactions or other flows recorded in the sequence of accounts.

## B. ACCOUNTS AND THEIR CORRESPONDING ECONOMIC ACTIVITIES

5. The purpose of this section is to give a very brief summary of the main sequence of accounts in order to describe the main features of the System before discussing other related issues. It is impossible to do justice to the wealth of information contained in the System in a short section of this kind, and reference should be made to

chapter II of the 1993 SNA and 2008 SNA for a comprehensive overview of the System.

### *1. The sequence of accounts*

#### *Current accounts*

6. These accounts record the production of goods and services, the generation of incomes by production, the subsequent distribution and redistribution of incomes among institutional units, and the use of incomes for purposes of consumption or saving.

#### *Production account*

7. The production account records the activity of producing goods and services as defined within the System. Its balancing item, gross value added, is defined as the value of output less the value of intermediate consumption and is a measure of the contribution to GDP made by an individual producer, industry or sector. Gross value added is the source from which the primary incomes of the System are generated and is therefore carried forward into the primary distribution of income account. Value added may also be measured net by deducting consumption of fixed capital.

#### *Distribution and use of income accounts*

8. These consist of a set of articulated accounts showing how incomes are:

Generated by production

Distributed to institutional units with claims on the value added created by production

Redistributed among institutional units, mainly by government units through social security contributions and benefits and taxes

Eventually used by households, government units or non-profit institutions serving households (NPISHs) for purposes of final consumption or saving.

9. The balancing item emerging from the complete set of income accounts is saving. The income accounts have considerable intrinsic economic interest in themselves. In particular, they are needed to explain the behaviour of institutional units as final consumers - that is, as users of the goods and services emanating from production for the satisfaction of the individual and collective needs and wants of households and the community. The balancing item, saving, is carried forward

into the capital account, the first in the System's sequence of accumulation accounts.

#### *Accumulation accounts*

10. These are flow accounts that record the acquisition and disposal of financial and non-financial assets and liabilities by institutional units through transactions or as a result of other events:

The capital account records acquisitions and disposals of non-financial assets as a result of transactions with other units or internal bookkeeping transactions linked to production (changes in inventories and consumption of fixed capital).

The financial account records acquisitions and disposals of financial assets and liabilities, also through transactions.

A third account, the other changes in assets account, consists of two sub-accounts. The first, the other changes in volume of assets account, records changes in the amounts of the assets and liabilities held by institutional units or sectors as a result of factors other than transactions; for example, destruction of fixed assets by natural disasters. The second, the revaluation account, records those changes in the values of assets and liabilities that result from changes in their prices.

11. The link between the accumulation accounts and the income accounts is provided by the fact that saving - that is, disposable income that is not spent on consumption goods or services - must be used to acquire financial or non-financial assets of one kind or another, if only cash, the most liquid financial asset. When saving is negative, the excess of consumption over disposable income must be financed by disposing of assets or incurring liabilities. The financial account shows the way in which funds are channelled from one group of units to another, especially through financial intermediaries. Access to finance is a prerequisite for engaging in many types of economic activities.

#### *Balance sheets*

12. The balance sheets show the values of the stocks of assets and liabilities held by institutional units or sectors at the beginning and end of an accounting period. As already noted, the values of the assets and liabilities held at any moment in time vary automatically whenever any transactions, price changes or other changes affecting the volume of assets or liabilities held take place. These are all recorded in one or another of the accumulation accounts so

that the difference between the values in the opening and closing balance sheets is entirely accounted for within the System, provided, of course, that the assets and liabilities recorded in the balance sheets are valued consistently with the transactions and other changes - that is, at current prices.

## 2. *Activities and transactions*

13. The accounts of the System are designed to provide analytically useful information about the behaviour of institutional units and the activities in which they engage, such as production, consumption and the accumulation of assets. They usually do this by recording the values of the goods, services or assets involved in the transactions between institutional units that are associated with these activities rather than by trying to record or measure the physical processes directly. For example, the accounts do not record the physical consumption of goods and services by households - the eating of food or the burning of fuel within a given time period. Instead, they record the expenditures that households make on final consumption goods and services or, more generally, the values of the goods and services they acquire through transactions with other units, whether purchased or not. Data on transactions provide the basic source material from which the values of the various elements in the accounts are built up or derived. The use of transactions data has important advantages. First, the prices at which goods and services are exchanged in transactions between buyers and sellers on markets provide the information needed for valuing, directly or indirectly, all the items in the accounts. Secondly, a transaction that takes place between two different institutional units has to be recorded for both parties to the transaction and therefore generally appears twice in a system of macroeconomic accounts. This enables important linkages to be established in the System. For example, output is obtained by summing the amounts sold, bartered or transferred to other units plus the amounts entered into, less the amounts withdrawn from inventories. In effect, the value of output is obtained by recording the various uses of that output by means of data on transactions. In this way, flows of goods and services can be traced through the economic system from their producers to their eventual users. Some transactions are only internal bookkeeping transactions that are needed when a single unit engages in two activities, such as the production and consumption of the same good or service, but the great majority of transactions take place between different units on markets.

## C. THE INSTITUTIONAL SECTORS OF THE ECONOMY

14. The purpose of this section is to indicate very briefly the main sectors of the economy for which it is

possible to compile the full sequence of accounts summarized in the previous section. Two main kinds of institutional units, or transactors, are distinguished in the System - households and legal entities. The latter are either entities created for purposes of production, mainly corporations and non-profit institutions (NPIs), or government units, including social security funds. Institutional units are essentially units that are capable of owning goods and assets, incurring liabilities and engaging in economic activities and transactions with other units in their own right. For the purposes of the System, institutional units that are resident in the economy are grouped together into five mutually exclusive sectors composed of the following types of units:

Non-financial corporations

Financial corporations

Government units, including social security funds

NPIs serving households (NPISHs)

Households.

The five sectors together make up the total economy. Each sector is also divided into sub-sectors. For example, the non-financial and financial corporations sectors are divided to distinguish corporations subject to control by governments or foreign units from other corporations. The System makes provision for a complete set of flow accounts and balance sheets to be compiled for each sector, and sub-sector if desired, as well as for the total economy. The total number of accounts that may be compiled is therefore potentially quite large, depending upon the level of disaggregation that is required and feasible. Only by disaggregation into sectors and sub-sectors is it possible to observe the interactions between the different parts of the economy that need to be measured and analyzed for purposes of policy-making. The complete set of accounts at the level of the five main sectors is shown in annex V of the 1993 SNA and annex 2 of the 2008 SNA.

15. Institutional units that are resident abroad form the rest of the world. The System does not require accounts to be compiled in respect of economic activities taking place in the rest of the world, but all transactions between resident and non-resident units have to be recorded in order to obtain a complete accounting for the economic behaviour of resident units. Transactions between residents and non-residents are grouped together in a single account, the rest of the world account.

## D. OTHER FEATURES OF THE SYSTEM

16. The SNA is a rich and detailed economic accounting system that extends well beyond the main sequence of accounts to encompass other accounts or tables that either contain information that cannot be included in the main accounts or present information in alternative ways, such as matrices, that may be more appropriate for certain types of analysis. It is not proposed to list all these various elements at this point, as they are described in chapter II of the 1993 SNA and 2008 SNA, but it is useful to draw attention to two specific elements which play a major role in the System.

### *1. Supply and use tables*

17. In addition to the flow accounts and balance sheets described earlier, the central framework of the System also contains detailed supply and use tables in the form of matrices that record how supplies of different kinds of goods and services originate from domestic industries and imports and how those supplies are allocated between various intermediate or final uses, including exports. These tables involve the compilation of a set of integrated production and generation of income accounts for industries - that is, groups of establishments as distinct from institutional units - that are able to draw upon detailed data from industrial censuses or surveys. The supply and use tables provide an accounting framework within which the commodity flow method of compiling national accounts - in which the total supplies and uses of individual types of goods and services have to be balanced with each other - can be systematically exploited. The supply and use tables also provide the basic information for the derivation of detailed input-output tables that are extensively used for purposes of economic analysis and projections.

### *2. Price and volume measures*

18. The System also provides specific guidance about the methodology to be used to compile an integrated set of price and volume indices for flows of goods and services, gross value added and GDP that are consistent with the concepts and accounting principles of the System. It is recommended that annual chain indices should be used where possible, although fixed base indices may also be used when the volume measures for components and aggregates have to be additively consistent for purposes of economic analysis and modelling.

19. Rates of inflation and economic growth appropriately measured by price and volume indices for the main aggregates of the System are key variables both for the evaluation of past economic performance and as targets for the formulation of economic policy-making. They are an essential part of the System, especially given the

emergence of inflation as an endemic economic problem in many countries. The System also recognizes that the growth in the volume of GDP and the growth of an economy's real income are not the same because of trading gains or losses resulting from changes in international terms of trade.

## E. CONCEPTS

20. The contents of the SNA depend not only on the accounting structure itself - that is, on the type and format of the accounts - but also on the ways in which the items included in the accounts are defined and classified. The issues involved are not simply of a technical nature but raise fundamental questions of economic theory and principles. The concepts and classifications used in the System have a considerable impact on the ways in which the data may be used and the interpretations placed on them.

### *1. The production boundary*

21. The activity of production is fundamental. In the System, production is understood to be a physical process, carried out under the responsibility, control and management of an institutional unit, in which labour and assets are used to transform inputs of goods and services into outputs of other goods and services. All goods and services produced as outputs must be such that they can be sold on markets or at least be capable of being provided by one unit to another, with or without charge. The System includes within the production boundary all production actually destined for the market, whether for sale or barter. It also includes all goods or services produced and provided free to individual households or collectively to the community by government units or NPISHs.

### *Household production*

22. The main problem for defining the range of activities recorded in the production accounts of the System is to decide upon the treatment of activities that produce goods or services that could have been supplied to others on the market but are actually retained by their producers for their own use. These cover a very wide range of productive activities, in particular:

- (a) The production of agricultural goods by household enterprises for own final consumption;
- (b) The production of other goods for own final use by households: the construction of dwellings, the production of foodstuffs and clothing, etc.;
- (c) The production of housing services for own final consumption by owner occupiers;

(d) The production of domestic and personal services for consumption within the same household: the preparation of meals, care and training of children, cleaning, repairs, etc.

All of these activities are productive in an economic sense. However, inclusion in the System is not simply a matter of estimating monetary values for the outputs of these activities. If values are assigned to the outputs, values have also to be assigned to the incomes generated by their production and to the consumption of the output. It is clear that the economic significance of these flows is very different from that of monetary flows. For example, the incomes generated are automatically tied to the consumption of the goods and services produced; they have little relevance for the analysis of inflation or deflation or other disequilibria within the economy. The inclusion of large non-monetary flows of this kind in the accounts together with monetary flows can obscure what is happening on markets and reduce the analytic usefulness of the data.

23. The SNA is a multi-purpose system. It is designed to meet wide a range of analytical and policy needs. A balance has to be struck between the desire for the accounts to be as comprehensive as possible and the need to prevent flows used for the analysis of market behaviour and disequilibria from being swamped by non-monetary values. The System therefore includes all production of goods for own use within its production boundary, as goods can be switched between market and non-market use even after they have been produced, but it excludes all production of services for own final consumption within households (except for the services produced by employing paid domestic staff and the own-account production of housing services by owner occupiers). These services are consumed as they are produced and the links between their production and market activities are more tenuous than for goods production, such as agricultural goods which households may produce partly for own final consumption and partly for sale, or barter, on the market. The location of the production boundary in the System is a compromise, but a deliberate one that takes account of the needs of most users. In this context it may be noted that in labour force statistics economically active persons are defined as those engaged in productive activities as defined in the SNA. If the production boundary were extended to include the production of personal and domestic services by members of households for their own final consumption, all persons engaged in such activities would become self-employed, making unemployment virtually impossible by definition. This illustrates the need to confine the production boundary in the SNA and other related statistical systems to market activities or fairly close substitutes for market activities.

#### *Other production boundary problems*

24. Certain natural processes may or may not be counted as production depending upon the circumstances in which they occur. A necessary condition for an activity to be treated as productive is that it must be carried out under the instigation, control and responsibility of some institutional unit that exercises ownership rights over whatever is produced. For example, the natural growth of stocks of fish in open seas is not counted as production: the process is not managed by any institutional unit and the fish do not belong to any institutional unit. On the other hand, the growth of fish in fish farms is treated as a process of production in much the same way that rearing livestock is a process of production. Similarly, the natural growth of wild, uncultivated forests or wild fruits or berries is not counted as production, whereas the cultivation of crop-bearing trees, or trees grown for timber or other uses, is counted in the same way as the growing of annual crops. However, the deliberate felling of trees in wild forests, and the gathering of wild fruit or berries, and also firewood, counts as production. Similarly, rainfall and the flow of water down natural watercourses are not processes of production, whereas storing water in reservoirs or dams and the piping, or carrying, of water from one location to another all constitute production.

25. These examples show that many activities or processes that may be of benefit to institutional units, both as producers and consumers, are not processes of production in an economic sense. Rainfall may be vital to the agricultural production of a country but it is not a process of production whose output can be included in GDP.

#### *2. The consumption boundary*

26. The coverage of production in the System has ramifications that extend considerably beyond the production account itself. The boundary of production determines the amount of value added recorded and hence the total amount of income generated by production. The range of goods and services that are included in household final consumption expenditures, and actual consumption, is similarly governed by the production boundary; for example, these expenditures include the estimated values of the agricultural products consumed by households that they have produced themselves and also the values of the housing services consumed by owner occupiers, but not the values of "do-it-yourself" repairs and maintenance to vehicles or household durables, the cleaning of dwellings, the care and training of children, or similar domestic or personal services produced for own final consumption. Only the expenditures on goods utilized for these purposes - e.g., cleaning materials - are included in household final consumption expenditures.

### 3. *The asset boundary*

27. Balance sheets are compiled for institutional units, or sectors, and record the values of the assets they own or the liabilities they have incurred. Assets as defined in the System are entities that must be owned by some unit, or units, and from which economic benefits are derived by their owner(s) by holding or using them over a period of time. Financial assets and fixed assets are clearly covered by this definition. However, the ownership criterion is important for determining which naturally occurring - i.e., non-produced - assets are included in the System. Naturally occurring assets such as land, mineral deposits, fuel reserves, uncultivated forests or other vegetation and wild animals are included in the balance sheets provided that institutional units are exercising effective ownership rights over them - that is, are actually in a position to be able to benefit from them. Assets need not be privately owned and could be owned by government units exercising ownership rights on behalf of entire communities. Thus, many environmental assets are included within the System. Assets that are not included are those such as the atmosphere or open seas, over which no ownership rights can be exercised, or mineral or fuel deposits that have not been discovered or that are unworkable - i.e., incapable of bringing any benefits to their owners, given the technology and relative prices existing at the time.

28. Changes in the values of naturally occurring assets owned by institutional units between one balance sheet and the next are recorded in the accumulation accounts of the System. For example, the depletion of a natural asset as a result of its use in production is recorded in the other changes in volume of assets account, together with losses of fixed assets due to their destruction by natural disasters (floods, earthquakes, etc.). Conversely, when deposits or reserves of minerals or fuels are discovered or previously unworkable deposits become workable, their appearance is recorded in this account and they enter the balance sheets in this way.

### 4. *National boundaries*

29. The accounts of the System are compiled for resident institutional units grouped into institutional sectors and sub-sectors. The concept of residence is the same as that used in the Balance of Payments Manual of the International Monetary Fund (IMF). An institutional unit is said to be resident within the economic territory of a country when it maintains a centre of economic interest in that territory - that is, when it engages, or intends to engage, in economic activities or transactions on a significant scale either indefinitely or over a long period of time, usually interpreted as one year. As an aggregate measure of production, the GDP of a country is equal to the sum of the gross values added of all resident institutional

units engaged in production (plus any taxes, and minus any subsidies, on products not included in the value of their outputs). This is not exactly the same as the sum of the gross values added of all productive activities taking place within the geographical boundaries of the national economy. Some of the production of a resident institutional unit may take place abroad - for example, the installation of some exported machinery or equipment or a consultancy project undertaken by a team of expert advisers working temporarily abroad. Conversely, some of the production taking place within a country may be attributable to foreign institutional units.

### F. USES OF THE SNA

30. The SNA is a multi-purpose system, as stated above, designed for economic analysis, decision-taking and policy-making, whatever the industrial structure or stage of economic development reached by a country. The basic concepts and definitions of the System depend upon economic reasoning and principles which should be universally valid and invariant to the particular economic circumstances in which they are applied. Similarly, the classifications and accounting rules are meant to be universally applicable. There is no justification, for example, for seeking to define the components of a production account - output, intermediate consumption and gross value added - differently in less developed than in more developed economies, or in large relatively closed economies than in small open economies, or in high-inflation economies than in low-inflation economies. Certain definitions, or accounting rules, specified in the System may become superfluous in certain circumstances (e.g., when there is no inflation), but it is nevertheless necessary for a general system such as the SNA to include definitions and rules covering as wide a range of circumstances as possible.

31. The fact that data needs and priorities, and also statistical capabilities, may vary considerably between different kinds of countries does not justify the construction of different systems with different concepts, definitions, classifications or accounting rules. Some countries may be able, at least initially, to calculate only a small number of accounts and tables for the total economy with little or no disaggregation into sectors, but a reduced set of accounts or tables does not constitute an alternative system. It is not appropriate to try to lay down general priorities for data collection when economic circumstances may vary so much from one country to another. In practice, priorities can only be established country by country by economic analysts or policy-makers familiar with the economic situation, needs and problems of the individual countries in question. It is not useful, for example, to try to specify general priorities for developing countries when they constitute a very heterogeneous group of countries at

a world level. Data priorities may vary as much between one developing country and another as between a developing and a developed country.

### *1. Specific uses*

32. The main objective of the SNA is to provide a comprehensive conceptual and accounting framework which can be used to create a macroeconomic database suitable for analyzing and evaluating the performance of an economy. The existence of such a database is a prerequisite for informed, rational policy-making and decision-taking. Some of the more specific uses of the SNA are described in the following sections.

#### *Monitoring the behaviour of the economy*

33. National accounts data provide information covering both different types of economic activities and the different sectors of the economy. It is possible to monitor the movements of major economic flows such as production, household consumption, government consumption, capital formation, exports, imports, wages, profits, taxes, lending, borrowing, etc., the flows of goods and services being recorded at both current and constant prices. Moreover, information is provided about certain key balancing items and ratios which can only be defined and measured within an accounting framework - for example, the budget surplus or deficit, the share of income which is saved, or invested, by individual sectors of the economy or the economy as a whole, the trade balance, etc. National accounts also provide the background against which movements of short-term indicators, such as monthly indices of industrial production or of consumer or producer prices, can be interpreted and evaluated. The monitoring of the behaviour of the economy may be significantly improved if at least some of the main aggregates of the System are compiled quarterly as well as annually, although many of the accounts, tables or balance sheets of the System are not usually compiled more frequently than once a year.

#### *Macroeconomic analysis*

34. National accounts are also used to investigate the causal mechanisms at work within an economy. Such analysis usually takes the form of the estimation of the parameters of functional relationships between different economic variables by applying econometric methods to time series data at both current and constant prices which are compiled within a national accounting framework. The types of macroeconomic models used for such investigations may vary according to the school of economic thought of the investigator as well as the objectives of the analysis, but the System is sufficiently flexible to accommodate the requirements of different economic theories or models, provided only that they

accept the basic concepts of production, consumption, income, etc. on which the System is based.

35. Advances in computer technology have made it possible for the econometric analysis of large macroeconomic models to be carried out on microcomputers. Many econometric software packages have been developed for this purpose so that this kind of modelling is no longer confined to a few government departments, research institutes or universities with large mainframe computers. It is increasingly being undertaken by private corporations or institutions with only limited resources available for these purposes.

#### *Economic policy-making and decision-taking*

36. Economic policy in the short term is formulated on the basis of an assessment of the recent behaviour and current state of the economy and a view, or precise forecast, about likely future developments. Short-term forecasts are typically made using econometric models of the type just described. Over the medium- or long-term, economic policy has to be formulated in the context of a broad economic strategy which may need to be quantified in the form of a plan. Most of the elements which make up a medium- or long-term economic plan consist of national accounts flows, and it may be impossible to draw up such a plan without them. A good macroeconomic model which accurately reflects the past performance of the economy may be indispensable for planning as well as forecasting.

37. Economic policy-making and decision-taking take place at all levels of government and also within public and private corporations. Large corporations such as multinationals have the ability to build their own macroeconomic models tailored to their own requirements, for which they need national accounts data. The investment programmes of major corporations must be based on long-term expectations about future economic developments that require national accounts data. There are also, of course, specialist agencies that provide forecasts for individual clients in return for fees. Such agencies typically require very detailed national accounts data.

#### *International comparisons*

38. The SNA is the system used for reporting to international or supranational organizations national accounts data that conform to standard, internationally accepted concepts, definitions and classifications. The resulting data are widely used for international comparisons of the volumes of major aggregates, such as GDP or GDP per head, and also for comparisons of structural statistics, such as ratios of investment, taxes or government expenditures to GDP. Such comparisons are used by economists, journalists or other analysts to

evaluate the performance of one economy against that of other similar economies. They can influence popular and political judgements about the relative success of economic programmes in the same way as developments over time within a single country. Databases consisting of sets of national accounts for groups of countries can also be used for econometric analyses in which time-series and cross-section data are pooled to provide a broader range of observations for the estimation of functional relationships.

39. Levels of GDP or, alternatively, gross national income (GNI) per head in different countries are also used by international organizations to determine eligibility for loans, aid or other funds or to determine the terms or conditions on which such loans, aid or funds are made available. When the objective is to compare the volumes of goods or services produced or consumed per head, data in national currencies must be converted into a common currency by means of purchasing power parities and not exchange rates. It is well known that, in general, neither market nor fixed exchange rates reflect the relative internal purchasing powers of different currencies. When exchange rates are used to convert GDP, or other statistics, into a common currency the prices at which goods and services in high-income countries are valued tend to be higher than in low-income countries, thus exaggerating the differences in real incomes between them. Exchange rate converted data must not, therefore, be interpreted as measures of the relative volumes of goods and services concerned. Levels of GDP, or GDP per head, in different countries are also used to determine, in whole or in part, the size of the contributions which the member countries of an international organization make to finance the operations of the organization.

40. Although international organizations use the SNA in order to be able to collect internationally comparable national accounts data, the SNA has not been created for this purpose. It has become the standard, or universal, system used with little or no modification by most countries in the world for their own national purposes. National statistical offices and government agencies have a strong vested interest in ensuring that the SNA meets their own analytic and policy requirements and have taken an active part in the development of the System for this reason.

## *2. Flexibility of implementation and use*

41. The SNA is designed to be sufficiently comprehensive that individual countries, whatever their economic structures, institutional arrangements or level of development, can select from within it those parts of the System which are considered to be most relevant and useful to implement in the light of their own needs and capabilities. The SNA is meant to be implemented in a

flexible manner and the accounts and tables, classifications and sectoring presented in this volume should not be regarded as fixed. In some cases, the System explicitly insists on flexibility. For example, two alternative methods of sub-sectoring the general government sector are proposed in chapter IV of the 1993 SNA and 2008 SNA without either being assigned priority. Similarly, although the System suggests sub-sectoring the households sector on the basis of the household's principal source of income, it stresses that this is only one possible criterion for sub-sectoring. In some cases, it may be more appropriate to sub-sector on the basis of socio-economic criteria or the type of area in which the household is located or, indeed, to carry the disaggregation of the households sector further by using two or more criteria together in a hierarchical manner.

42. Ways in which the System may be adapted to meet differing circumstances and needs are specifically addressed in chapter XIX of the 1993 SNA. For example, classifications of institutional units, transactions and assets may be implemented flexibly in order to adapt them to the data availability and special circumstances of different countries. The flexible use of classifications does not change the basic concepts and definitions of the System. However, as explained in chapter XXI of the 1993 SNA and chapter 29 of the 2008 SNA, flexibility may be taken a stage further by developing satellite accounts that are closely linked to the main System but are not bound to employ exactly the same concepts or restricted to data expressed in monetary terms. Satellite accounts are intended for special purposes such as monitoring the community's health or the state of environment. They may also be used to explore new methodologies and to work out new accounting procedures that, when fully developed and accepted, may become absorbed into the main System in the course of time, in the way that input-output analysis, for example, has been integrated into the System.

43. Another way in which the System may be implemented flexibly is by rearranging the data in the accounts in the form of a social accounting matrix in order better to serve particular analytical and policy needs. Such matrices should not be construed as constituting different systems but as alternative ways of presenting the mass of information contained in the System which many users and analysts find more informative and powerful for both monitoring and modelling social and economic development.

## *3. The SNA as a coordinating framework for statistics*

44. The System also has a very important statistical function by serving as a coordinating framework for economic statistics in two different senses: first, as the conceptual framework for ensuring the consistency of the

definitions and classifications used in different, but related, fields of statistics, and secondly, as an accounting framework for ensuring the numerical consistency of data drawn from different sources, such as industrial inquiries, household surveys, merchandise trade statistics, VAT returns and other administrative sources.

## G. HARMONIZATION BETWEEN DIFFERENT STATISTICAL SYSTEMS

45. The SNA and related statistical systems need to be as consistent as possible in respect of their basic concepts, definitions and classifications. National accounts have always occupied a central position in economic statistics because the data from more specialized systems, such as balance of payments or labour force statistics, typically have to be used in conjunction with national accounts data. Consistency between the different systems enhances the analytical usefulness of all the statistics involved. The harmonization of the SNA and related statistical systems, such as financial statistics or balance of payments statistics, has been one of the driving forces behind revisions of the System.

46. Revisions of other statistical systems have been conducted in parallel with, and in close collaboration with, that of the SNA in order to eliminate conceptual differences between them other than a few exceptions that can be specifically justified in terms of the special characteristics of different kinds of data, or the special requirements of different kinds of users. Harmonization between the SNA and other major systems has been largely successful and has been achieved by making changes to the SNA as well as to the other systems.

47. Because of the active involvement of the IMF in the revision of the 1993 SNA and 2008 SNA, the harmonization process has been particularly effective in respect of balance of payments statistics, government finance statistics and money and banking statistics. Each of these three systems was updated to be consistent with the 1993 SNA and 2008 SNA to the fullest extent possible.

48. Various other revised international guidelines were issued at about the same time as the 1993 SNA and 2008 SNA. These include the third and fourth revisions of the United Nations International Standard Industrial Classification of All Economic Activities (ISIC), the industrial classification that is used in the 1993 SNA and 2008 SNA respectively. The establishment as described in ISIC is also the statistical unit used to compile the production accounts by industry that make up supply and use tables of the SNA, the concept of the establishment being the same in both the SNA and ISIC. The International Labour Organisation (ILO) has issued revised standards on labour statistics that define employment in a way that is consistent with the boundary of production in

the SNA, as summarized earlier in this chapter. An extract from the resolution of the Fifteenth International Conference of Labour Statisticians concerning the distinction between the formal and informal sectors is reproduced as an annex to chapter IV of the 1993 SNA. The informal aspects of the economy is further elaborated in chapter 25 of the 2008 SNA. Another example is provided by the revised Handbook on Agricultural Accounts, prepared by the Food and Agricultural Organization of the United Nations (FAO), which has been brought into line with the treatment of agricultural products and activities in the SNA. It is neither necessary nor feasible to list here all the revisions to international statistical systems and standards that are being undertaken or planned as it is the policy of all the various international agencies involved at a world level to harmonize these systems with each other and with the SNA to the fullest extent possible.

## H. IMPLEMENTATION OF CONCEPTS

49. The contents of the accounts are determined not only by the conceptual framework, definitions and classifications of the System but also by the ways in which they are interpreted and implemented in practice. However simple and precise concepts and classifications may appear in principle, there are inevitably difficult borderline cases which cannot easily be fitted into predetermined categories. These points may be illustrated by considering a fundamental distinction in economics and in the System, namely, the distinction between consumption and gross fixed capital formation (or gross fixed investment, as it is often described in other contexts).

### *1. Final consumption, intermediate consumption and gross fixed capital formation*

50. Consumption is an activity in which institutional units use up goods or services. There are two quite different kinds of consumption. Intermediate consumption consists of inputs into processes of production that are used up within the accounting period. Final consumption consists of goods and services used by individual households or the community to satisfy their individual or collective needs or wants. The activity of gross fixed capital formation, on the other hand, is restricted to institutional units in their capacity as producers, being defined as the value of their acquisitions less disposals of fixed assets. Fixed assets are produced assets (mostly machinery, equipment, buildings or other structures but also including some intangible assets) that are used repeatedly or continuously in production over several accounting periods (more than one year).

51. The general nature and purpose of the distinction between gross fixed capital formation and consumption,

whether intermediate or final, is clear. The distinction is fundamental for economic analysis and policy-making. Nevertheless, the borderline between consumption and gross fixed capital formation is not always easy to determine in practice. Certain activities contain some elements that appear to be consumption and at the same time others that appear to be capital formation. In order to try to ensure that the System is implemented in a uniform way decisions have to be taken about the ways in which certain difficult, even controversial, items are to be classified. Some examples are given below.

#### *Training, research and development*

52. Expenditures by enterprises on activities such as staff training or research and development are not the type of intermediate inputs whose consumption is determined by the level at which production is carried out in the current period but are designed to raise productivity or increase the range of production possibilities in the future, in much the same way as expenditures on machinery, equipment, buildings and other structures. However, expenditures on training and research or development do not lead to the acquisition of assets that can be easily identified, quantified and valued for balance sheet purposes. Such expenditures continue to be classified as intermediate consumption, therefore, even though it is recognized that they may bring future benefits. In fact, many other expenditures undertaken by enterprises may also have impacts in future periods as well as the current period - for example, market research, advertising and expenditures on health and safety that affect the well-being and attitudes of the workforce.

#### *Education*

53. It is often proposed that expenditures on education should also be classified as gross fixed capital formation as a form of investment in human capital. The acquisition of knowledge, skills and qualifications increases the productive potential of the individuals concerned and is a source of future economic benefit to them. However, while knowledge, skills and qualifications are clearly assets in a broad sense of the term, they cannot be equated with fixed assets as understood in the System. They are not produced because they are acquired through learning, studying and practicing - activities that are not themselves processes of production. The education services produced by schools, colleges, universities, etc. are consumed by students in the process of their acquiring knowledge and skills. Education assets are embodied in individuals as persons. They cannot be transferred to others and cannot be shown in the balance sheets of the enterprises in which the individuals work (except in rare cases when certain highly skilled individuals are under contract to work for particular employers for specified periods). Education assets could possibly be shown in

balance sheets for the individuals in which they are embodied, but individuals are not enterprises. They would be difficult to value, bearing in mind that the remuneration received by a skilled worker depends upon the amount of time and effort expended and is not simply a return payable to the owner of an asset.

54. It may also be noted that final consumption consists of the use of goods and services for the direct satisfaction of human needs or wants, individually or collectively. Education services are undoubtedly consumed in this sense. They increase the welfare and improve the general quality of life of those consuming them. Moreover, they are not the only services consumed by individuals to bring long- as well as short-term benefits. For example, the consumption of health services brings long-term benefits and even the consumption of basic items such as food and housing is necessary in order to keep an individual in good health - and good working order.

#### *Repairs, maintenance and gross fixed capital formation*

55. Another, less familiar, example of the intrinsic difficulty of trying to draw a dichotomy between consumption and gross fixed capital formation is provided by repairs and maintenance. Ordinary maintenance and repairs undertaken by enterprises to keep fixed assets in good working order are intermediate consumption. However, major improvements, additions or extensions to fixed assets, both machinery and structures, which improve their performance, increase their capacity or prolong their expected working lives count as gross fixed capital formation. In practice it is not easy to draw the line between ordinary repairs and major improvements, although the System provides certain guidelines for this purpose. Some analysts, however, consider that the distinction between ordinary repairs and maintenance and major improvements and additions is neither operational nor defensible and would favour a more "gross" method of recording in which all such activities are treated as gross fixed capital formation.

#### *2. Interpretation of the distinction between consumption and gross fixed capital formation*

56. The examples given above show that a simple dichotomy between consumption and gross fixed capital formation inevitably presents problems when dealing with flows of goods and services that do not fit comfortably under either heading. The issue is not simply how to classify certain flows, but also how to achieve an economically meaningful and feasible set of accounting procedures for the assets acquired through gross fixed capital formation within an integrated, coherent set of

accounts encompassing past and future periods as well as the present.

57. Some care and sophistication is needed in using the accounts. For example, goods and services "consumed" by households - i.e., acquired for the satisfaction of their needs or wants - are not suddenly "used up" and do not "vanish" at the moment of acquisition. In particular, households "consuming" services such as health and education may continue to derive benefits over long periods of time. The "consumption" of such services therefore has points of similarity with "investment" in assets. Similarly, enterprises may continue to benefit over long periods of time from the intermediate consumption of services such as maintenance and repairs, training, research and development, market research, etc. Thus, while the acquisition of fixed assets by enterprises - that is, gross fixed capital formation - is undertaken specifically to enhance future production possibilities, they are not the only types of expenditure that may be expected to bring future benefits.

58. The decision whether to classify certain types of expenditure by households or government, such as education or health services, as final consumption expenditures or gross fixed capital formation does not affect the size of GDP, as both are final expenditures. On the other hand, the decision to classify certain expenditures by enterprises as intermediate consumption rather than gross fixed capital formation does reduce the gross value added and operating surplus of the enterprise and hence GDP as a whole. However, treating certain expenditures as intermediate reduces not only gross fixed capital formation but also consumption of fixed capital in subsequent periods. It is therefore an open question as to how net value added and net domestic product (NDP) are affected in the longer term, depending upon the pattern of the relevant expenditures over time.

## I. DEFINITIONS OF IMPORTANT TERMS (GLOSSARY)

### *Acquisitions*

Goods and services are acquired by institutional units when they become the new owners of the goods or when the delivery of services to them is completed.

### *Actual final consumption of general government*

Actual final consumption of general government is measured by the value of the collective (as opposed to individual) consumption services provided to the community, or large sections of the community, by general government; it is derived from their final consumption

expenditure by subtracting the value of social transfers in kind payable.

### *Actual final consumption of households*

Actual final consumption of households is the value of the consumption goods acquired by households, whether by purchase in general, or by transfer from government units or NPISHs, and used by them for the satisfaction of their needs and wants; it is derived from their final consumption expenditure by adding the value of social transfers in kind receivable.

### *Actual final consumption of NPISHs*

NPISHs have no actual final consumption because most of the services provided by NPISHs are individual in nature and, for simplicity, all services provided by NPISHs are treated by convention as social transfers.

### *Additivity*

Additivity is a property pertaining to a set of interdependent index numbers related by definition or by accounting constraints under which an aggregate is defined as the sum of its components; additivity requires this identity to be preserved when the values of both an aggregate and its components in some reference period are extrapolated over time using a set of volume index numbers.

### *Base period*

The period that provides the weights for an index is described as the base period.

### *Basic price*

The basic price is the amount receivable by the producer from the purchaser for a unit of a good or service produced as output minus any tax payable, and plus any subsidy receivable, on that unit as a consequence of its production or sale; it excludes any transport charges invoiced separately by the producer.

### *C.i.f. price*

The c.i.f. price (i.e. cost, insurance and freight price) is the price of a good delivered at the frontier of the importing country, including any insurance and freight charges incurred to that point, or the price of a service delivered to a resident, before the payment of any import duties or other taxes on imports or trade and transport margins within the country.

### *Capital transfers*

Capital transfers are transactions in which the ownership of an asset (other than cash and inventories) is transferred from one institutional unit to another, in which cash is transferred to enable the recipient to acquire another asset or in which the funds realized by the disposal of another asset are transferred.

### *Chain indices*

Chain indices are obtained by linking price (or volume) indices for consecutive periods by using weighting patterns appropriate to those periods.

### *Changes in inventories (including work-in-progress)*

Changes in inventories (including work-in-progress) are measured by the value of the entries into inventories less the value of withdrawals and the value of any recurrent losses of goods held in inventories.

### *Compensation of employees*

Compensation of employees is the total remuneration, in cash or in kind, payable by enterprises to employees in return for work done by the latter during the accounting period.

### *Constant prices*

Constant prices are obtained by directly factoring changes over time in the values of flows of goods and services into two components reflecting changes in the prices of the goods and services concerned and changes in their volumes (i.e. changes in “constant price terms”).

### *Consumption good or service*

A consumption good or service is one that is used (without further transformation in production) by households, NPISHs or government units for the direct satisfaction of individual needs or wants or the collective needs of members of the community.

### *Consumption of fixed capital*

Consumption of fixed capital represents the reduction in the value of the fixed assets used in production during the accounting period resulting from physical deterioration, normal obsolescence or normal accidental damage.

### *Current transfers*

Current transfers consist of all transfers that are not transfers of capital; they directly affect the level of

disposable income and should influence the consumption of goods or services.

### *Deductible VAT*

Deductible VAT is the amount of VAT payable on purchases of goods or services intended for intermediate consumption, gross fixed capital formation or for resale which a producer is permitted to deduct from his own VAT liability to the government in respect of VAT invoiced to his customers.

### *Disposals*

Disposals of assets (inventories, fixed assets or land or other non-produced assets) by institutional units occur when one of those units sells any of the assets to another institutional unit.

### *Export subsidies*

Export subsidies consist of all subsidies on goods and services that become payable to resident producers when the goods leave the economic territory or when the services are delivered to non-resident units; they include direct subsidies on exports, losses of government trading enterprises in respect of trade with non-residents, and subsidies resulting from multiple exchange rates.

### *Export taxes*

Export taxes are taxes on goods or services that become payable when the goods leave the economic territory or when the services are delivered to non-residents; they include export duties, profits of export monopolies and taxes resulting from multiple exchange rates.

### *Exports of goods*

Exports of goods consist of exports of the following items from residents to non-residents, generally with a change of ownership being involved: general merchandise, goods for processing, goods procured in domestic ports by non-resident carriers, and non-monetary gold.

### *Exports of services*

Exports of services consist of the following services provided by residents to non-residents: transportation; travel; communications; construction; insurance; financial; computer and information; royalties and licence fees; other business services; personal, cultural, and recreational services; and government services n.i.e.

### *F.o.b. price*

The f.o.b. price (free on board price) is the c.i.f. price less the costs of transportation and insurance charges, between the customs frontier of the exporting (importing) country and that of the importing (exporting) country.

#### *Factor cost*

Gross value added at factor cost is not a concept used explicitly in the System but it can easily be derived by subtracting the value of any taxes, less subsidies, on production payable out of gross value added.

#### *Final consumption*

Final consumption consists of goods and services used up by individual households or the community to satisfy their individual or collective needs or wants.

#### *Final consumption expenditure of government*

Government final consumption expenditure consists of expenditure, including imputed expenditure, incurred by general government on both individual consumption goods and services and collective consumption services.

#### *Final consumption expenditure of households*

Household final consumption expenditure consists of the expenditure, including imputed expenditure, incurred by resident households on individual consumption goods and services, including those sold at prices that are not economically significant.

#### *Final consumption expenditure of NPISHs*

Final consumption expenditure of NPISHs consists of the expenditure, including imputed expenditure, incurred by resident NPISHs on individual consumption goods and services.

#### *Financial intermediation services indirectly measured (FISIM)*

Financial intermediation services indirectly measured (FISIM) is an indirect measure of the value of financial intermediation services provided but for which financial institutions do not charge explicitly.

#### *Fixed assets*

Fixed assets are tangible or intangible assets produced as outputs from processes of production that are themselves used repeatedly or continuously in other processes of production for more than one year.

#### *Goods*

Goods are physical objects for which a demand exists, over which ownership rights can be established and whose ownership can be transferred from one institutional unit to another by engaging in transactions on markets.

#### *Gross*

The term “gross” is a common means of referring to values before deducting consumption of fixed capital (generally used as in “gross capital stock” or “gross domestic product”).

#### *Gross capital formation*

Gross capital formation is measured by the total value of the gross fixed capital formation, changes in inventories and acquisitions less disposals of valuables for a unit or sector.

#### *Gross domestic product - expenditure based*

Expenditure-based gross domestic product is total final expenditures at purchasers’ prices (including the f.o.b. value of exports of goods and services), less the f.o.b. value of imports of goods and services.

#### *Gross domestic product - income based*

Income-based gross domestic product is compensation of employees, plus taxes less subsidies on production and imports, plus gross mixed income, plus gross operating surplus.

#### *Gross domestic product - output based*

Output-based gross domestic product is the sum of the gross values added of all resident producers at producers’ prices, plus taxes less subsidies on imports, plus all non-deductible VAT (or similar taxes).

#### *Gross domestic product at market prices*

Gross domestic product at market prices is the sum of the gross values added of all resident producers at producers’ prices, plus taxes less subsidies on imports, plus all non-deductible VAT (or similar taxes).

#### *Gross fixed capital formation*

Gross fixed capital formation is measured by the total value of a producer’s acquisitions, less disposals, of fixed assets during the accounting period plus certain additions to the value of non-produced assets (such as subsoil assets or major improvements in the quantity, quality or

productivity of land) realized by the productive activity of institutional units.

#### *Gross national disposable income*

Gross national disposable income may be derived from gross national income by adding all current transfers in cash or in kind receivable by resident institutional units from non-resident units and subtracting all current transfers in cash or in kind payable by resident institutional units to non-resident units.

#### *Gross national income (GNI)*

Gross national income (GNI) is GDP less net taxes on production and imports, less compensation of employees less property income payable to the rest of the world plus the corresponding items receivable from the rest of the world (in other words, GDP less primary incomes payable to non-resident units plus primary incomes receivable from non-resident units); an alternative approach to measuring GNI at market prices is as the aggregate value of the balances of gross primary incomes for all sectors; (note that gross national income is identical to gross national product (GNP) as previously used in national accounts generally).

#### *Gross saving*

Gross saving is gross disposable income less final consumption expenditure.

#### *Gross value added*

Gross value added is the value of output less the value of intermediate consumption; it is a measure of the contribution to GDP made by an individual producer, industry or sector.

#### *Gross value added at basic prices*

Gross value added at basic prices is output valued at basic prices less intermediate consumption valued at purchasers' prices.

#### *Gross value added at producers' prices*

Gross value added at producers' prices is output valued at producers' prices less intermediate consumption valued at purchasers' prices.

#### *Import duties*

Import duties consist of customs duties, or other import charges, which are payable on goods of a particular type when they enter the economic territory.

#### *Import subsidies*

Import subsidies consist of subsidies on goods and services that become payable to resident producers when the goods cross the frontier of the economic territory or when the services are delivered to resident institutional units.

#### *Imports of goods*

Imports of goods consist of imports of the following items from non-residents to residents, generally with a change of ownership being involved: general merchandise, goods for processing, goods procured in foreign ports by domestic carriers, and non-monetary gold.

#### *Imports of services*

Imports of services consist of the following services purchased by residents from non-residents: transportation; travel; communications; construction; insurance; financial; computer and information; royalties and licence fees; other business services; personal, cultural, and recreational services; and government services n.i.e.

#### *Indirect taxes*

As traditionally understood, indirect taxes are taxes that supposedly can be passed on, in whole or in part, to other institutional units by increasing the prices of the goods or services sold but the term "indirect taxes" is not used in 1993 SNA and 2008 SNA; rather, taxes are specifically identified by their purpose (e.g. taxes on products).

#### *Intermediate consumption*

Intermediate consumption consists of the value of the goods and services consumed as inputs by a process of production, excluding fixed assets whose consumption is recorded as consumption of fixed capital; the goods or services may be either transformed or used up by the production process.

#### *Inventories*

Inventories consist of stocks of outputs that are still held by the units that produced them prior to their being further processed, sold, delivered to other units or used in other ways and stocks of products acquired from other units that are intended to be used for intermediate consumption or for resale without further processing.

#### *Invoiced VAT*

Invoiced VAT is the VAT payable on the sales of a producer; it is shown separately on the invoice which the producer presents to the purchaser.

### *Market prices*

Market prices for transactions are the amounts of money willing buyers pay to acquire something from willing sellers.

### *Mixed income*

Mixed income is the surplus or deficit accruing from production by unincorporated enterprises owned by households; it implicitly contains an element of remuneration for work done by the owner, or other members of the household, that cannot be separately identified from the return to the owner as entrepreneur but it excludes the operating surplus coming from owner-occupied dwellings.

### *Net*

The term “net” is a common means of referring to values after deducting consumption of fixed capital (generally used as in “net capital stock” or “net domestic product”); it should be noted, however, that the term “net” can be used in different contexts in the national accounts, such as “net income from abroad” which is the difference between two income flows.

### *Net income from abroad*

The difference between the total values of the primary incomes receivable from, and payable to, non-residents is often described as net income from abroad.

### *Net lending*

Net lending is the net amount a unit or a sector has available to finance, directly or indirectly, other units or other sectors; it is the balancing item in the capital account and is defined as: (Net saving plus capital transfers receivable minus capital transfers payable) minus (the value of acquisitions less disposals of non-financial assets, less consumption of fixed capital); negative net lending may also be described as “net borrowing”.

### *Net national disposable income*

Net national disposable income may be derived from net national income by adding all current transfers in cash or in kind receivable by resident institutional units from non-resident units and subtracting all current transfers in cash or in kind payable by resident institutional units to non-resident units.

### *Net national income*

The aggregate value of the balances of net primary incomes summed over all sectors is described as net national income.

### *Net saving*

Net saving is net disposable income less final consumption expenditure.

### *Net value added*

Net value added is the value of output less the values of both intermediate consumption and consumption of fixed capital.

### *Non-deductible VAT*

Non-deductible VAT is the VAT payable by a purchaser which is not deductible from his own VAT liability, if any.

### *Non-financial assets*

Non-financial assets are entities, over which ownership rights are enforced by institutional units, individually or collectively, and from which economic benefits may be derived by their owners by holding them, or using them over a period of time, that consist of tangible assets, both produced and non-produced, and most intangible assets for which no corresponding liabilities are recorded.

### *Non-produced assets*

Non-produced assets are non-financial assets that come into existence other than through processes of production.

### *Non-profit institutions serving households (NPISHs)*

Non-profit institutions serving households (NPISHs) consist of NPIs which are not financed and controlled by government and which provide goods or services to households free or at prices that are not economically significant.

### *Non-resident*

A unit is non-resident if its centre of economic interest is not in the domestic economic territory.

### *Operating surplus*

The operating surplus measures the surplus or deficit accruing from production before taking account of any interest, rent or similar charges payable on financial or tangible non-produced assets borrowed or rented by the

enterprise, or any interest, rent or similar receipts receivable on financial or tangible non-produced assets owned by the enterprise; (note: for unincorporated enterprises owned by households, this component is called “mixed income”).

#### *Other subsidies on production*

Other subsidies on production consist of subsidies, except subsidies on products, which resident enterprises may receive as a consequence of engaging in production (e.g., subsidies on payroll or workforce or subsidies to reduce pollution).

#### *Other subsidies on products*

Other subsidies on products consist of subsidies on goods or services produced as the outputs of resident enterprises that become payable as a result of the production, sale, transfer, leasing or delivery of those goods or services, or as a result of their use for own consumption or own capital formation; there are three broad categories: (1) subsidies on products used domestically, (2) losses of government trading organizations, and (3) subsidies to public corporations and quasi-corporations.

#### *Output*

Output consists of those goods or services that are produced within an establishment that become available for use outside that establishment, plus any goods and services produced for own final use.

#### *Producer’s price*

The producer’s price is the amount receivable by the producer from the purchaser for a unit of a good or service produced as output minus any VAT, or similar deductible tax, invoiced to the purchaser; it excludes any transport charges invoiced separately by the producer.

#### *Property income*

Property income is the income receivable by the owner of a financial asset or a tangible non-produced asset in return for providing funds to or putting the tangible non-produced asset at the disposal of, another institutional unit; it consists of interest, the distributed income of corporations (i.e., dividends and withdrawals from income of quasi-corporations), reinvested earnings on direct foreign investment, property income attributed to insurance policy holders, and rent.

#### *Purchaser’s price*

The purchaser’s price is the amount paid by the purchaser, excluding any deductible VAT or similar deductible tax, in order to take delivery of a unit of a good or service at the time and place required by the purchaser; the purchaser’s price of a good includes any transport charges paid separately by the purchaser to take delivery at the required time and place.

#### *Resident*

An institutional unit is resident in a country when it has a centre of economic interest in the economic territory of that country.

#### *Services*

Services are outputs produced to order and typically consist of changes in the conditions of the consuming units realized by the activities of producers at the demand of the consumers; by the time their production is completed they must have been provided to the consumers.

#### *Stocks*

Stocks are a position in, or holdings of, assets and liabilities at a point in time and the System records stocks in accounts, usually referred to as balance sheets, and tables at the beginning and end of the accounting period; stocks result from the accumulation of prior transactions and other flows, and they are changed by transactions and other flows in the period (note that stocks of goods are referred to as “inventories” in the System).

#### *Subsidies*

Subsidies are current unrequited payments that government units, including non-resident government units, make to enterprises on the basis of the levels of their production activities or the quantities or values of the goods or services which they produce, sell or import.

#### *Taxes and duties on imports*

Taxes and duties on imports, excluding VAT, consist of taxes on goods and services that become payable at the moment when the goods cross the national or customs frontiers of the economic territory or when the services are delivered by non-resident producers to resident institutional units.

#### *Taxes on production and imports*

Taxes on production consist of taxes payable on goods and services when they are produced, delivered, sold,

transferred or otherwise disposed of by their producers plus other taxes on production, consisting mainly of taxes on the ownership or use of land, buildings or other assets used in production or on the labour employed, or compensation of employees paid.

#### *Taxes on products*

Taxes on products, excluding VAT, import and export taxes, consist of taxes on goods and services that become payable as a result of the production, sale, transfer, leasing or delivery of those goods or services, or as a result of their use for own consumption or own capital formation.

#### *Transfer*

A transfer is a transaction in which one institutional unit provides a good, service or asset to another unit without receiving from the latter any good, service or asset in return as counterpart.

#### *Valuables*

Valuables are produced assets that are not used primarily for production or consumption, that are expected to appreciate or at least not to decline in real value, that do not deteriorate over time under normal conditions and that are acquired and held primarily as stores of value.

#### *Value added - gross*

Gross value added is the value of output less the value of intermediate consumption; it is a measure of the contribution to GDP made by an individual producer, industry or sector.

#### *Value added - net*

Net value added is the value of output less the values of both intermediate consumption and consumption of fixed capital.

#### *Value added tax (VAT)*

A value added tax (VAT) is a tax on products collected in stages by enterprises; it is a wide-ranging tax usually designed to cover most or all goods and services but producers are obliged to pay to government only the difference between the VAT on their sales and the VAT on their purchases for intermediate consumption or capital formation, while VAT is not usually charged on sales to non-residents (i.e., exports).

## II. COUNTRY TABLES

---

## Honduras

### Source

The preparation of national accounts statistics in Honduras is undertaken by the Departamento de Estadísticas Macroeconómicas, Subgerencia de Estudios Economicos Banco Central de Honduras, Tegucigalpa, D.C. The official estimates are published in "Cuentas Nacionales Anuales".

### General

The estimates shown in the following tables have been prepared in accordance with the classifications and definitions recommended in the United Nations System of National Accounts 1993 (1993 SNA) so far as the existing data would permit. When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in the SNA, a footnote provides explanation.

### Methodology:

#### Overview of GDP Compilation

Gross domestic product is estimated mainly through the production approach.

#### Expenditure Approach

The expenditure approach is used to estimate government final consumption expenditure and exports and imports of goods and services. The commodity-flow approach is used for private final consumption expenditure and for gross capital formation.

Government final consumption expenditure is estimated on the basis of government accounts. Changes in stocks are estimated on the basis of information obtained from various sectors such as the banana industry, the mines, the petroleum sector and the trade enterprises.

Private investment consists of gross value of production in the construction sector, plus imports and domestic production of capital goods which are adjusted to purchasers' values. Public investment is estimated from public sector data on settlements by type of construction and classes of machinery and equipment.

The estimates of exports and imports of goods and services are based on the balance of payment data.

The estimate of private consumption expenditure is based upon the income and expenditure survey for 1998 and the rate of population growth each year is applied to it. Private consumption expenditure is estimated as a residual.

For the constant price estimates, private final consumption expenditure is estimated as a residual while all other items of GDP by expenditure type are deflated by various price indexes.

#### Income Approach

Estimates of labour income are derived from sources such as censuses and surveys, supplemented by information on wages and salaries paid by various government agencies and other public bodies. Estimates of profits of enterprises and professional incomes are obtained from the Direccion Ejecutiva de Ingresos. Estimates of interest and dividend payments received by household and private non-profit institutions are derived as a residual. Indirect taxes and subsidies are estimated on the basis of government sources. For consumption of fixed capital, no specific information is available.

## Production Approach

The production approach is used to estimate value added of most industries. The income approach is, however, used to estimate value added of producers of government services, part of the transport sectors and other private services.

For the agricultural crop production, information is obtained directly from the most important export enterprises while for other products, estimates are obtained from consumption per capita data adjusted for exports and imports. Surveys are conducted to obtain information on basic production of grains. Agricultural censuses were held in 1953, 1965 and 1974. The Instituto Hondureño del Café provides complete information for coffee production. The banana companies in the northern zone are visited annually while for the rest of the country, consumption per capita data are taken into account together with prices collected from native producers. Livestock production information is gathered from the most important producers with adjustments made for clandestine or uncontrolled transaction. Inputs are estimated as 30 percent of the gross value of production.

The production in the forestry sector is calculated as a function of household and industrial consumption of firewood, and extrapolated by an index.

The estimates of fishing are calculated on the basis of information on survey economics, the foreign trade statistics and per capita consumption data.

For metal mining, the statistical information is obtained directly while estimates for non-metallic mineral are based on inputs used in the construction sector using certain coefficients derived from analysis of construction costs.

The estimates of manufacturing are based on economic surveys (Departamento de Estadísticas Macroeconómicas, Subgerencia de Estudios Economicos del Banco Central de Honduras).

Information on electricity, gas and water is obtained directly from concerned enterprises. The data available cover gross values of production, aggregated values, physical production, installed capacity and personal occupation.

Information on public construction is taken directly from the municipalities. Based on the information obtained from them, a sample is taken from which the growth of private construction can be measured. The population and housing censuses are also taken into account for dwellings.

For the trade sector, the estimates are based on the gross value of agricultural and industrial production by item. The value of imports and exports are estimated from foreign trade statistics and information received from the Dirección Ejecutiva de Ingresos.

In estimating road transport, information on registered vehicles for rental is used. Data on income and expenditure by type of vehicle, depreciation and profits are obtained. Information for financial institutions is obtained from the Comisión Nacional de Bancos y Seguros, which provides financial statements for all banks in the system and insurance companies.

The estimates of ownership of dwellings are based on census information for 1949, 1961 and 1974 covering the number of dwellings and the average rents paid and imputed.

For producers of government services, information is obtained directly from the Contaduría General de la República and Secretaría de Finanzas (Minister of Finance ).

For private services, use is made of employment data, classified by type of service rendered and data on average wages and salaries from other information sources. For domestic services, data on employment and wages are basis for estimating the value added with 75 per cent added to the cash figures for board and lodging as wages and salaries in kind.

For the constant price estimates, value added of the agricultural sector is either extrapolated by quantity indexes for output or deflated by price indexes. For the industrial activity sector, trade, transport and storage, financial institutions and insurance and private services, value added is extrapolated by quantity index. For the remaining sectors, current values are deflated by various price indexes.

# Hungary

## Source

Data compiled by the Hungarian Central Statistical Office (HCSO), Budapest and provided to the OECD by Eurostat. The official estimates are published in 'Magyarország Nemzeti Számlái', KSH.

## General

From September 2014, these national accounts estimates are compiled according to the 2008 SNA ('System of National Accounts 2008', Commission of the European Communities-Eurostat, International Monetary Fund, Organisation for Economic Co-operation and Development, United Nations and World Bank, 2009).

Detailed methodology of the Hungarian national accounts could be found in the Central Statistical Office website: <http://www.ksh.hu/docs/hun/xftp/idoszaki/gdpev/egdpevelo13.pdf>

The financial intermediation services indirectly measured (FISIM) are allocated to industries and institutional sectors.

Original chain constant price estimates are referenced to 2015.

## Methodology:

### Overview of GDP Compilation

The 2008 SNA and the ESA 2010 are used as the basic concepts to the estimation of national accounts.

GDP measures the total value of final goods and services produced by domestic institutional units during the period.

GDP includes all activities within the SNA production boundary, including illegal transactions such as prostitution and trade of narcotics, smuggling of tobacco and some hidden activities, for years 1995 and onwards.

Estimates are made for underreported and/or not surveyed production, for gross fixed capital formation (GFCF) of small size units and for household production and consumption for own use.

ESA 2010 is used for classifying institutional sectors. NACE Rev.2 is used as a national classification for industries by kind of activities. SITC Rev. 3 and HCN (Hungarian Combined Nomenclature) are used for international transactions. International transactions in services are based on the Balance of Payments Manual, 6th edition (BMP6). The COICOP classification is used for household final consumption and from 2010 the COFOG classification is used for the distinction of individual and collective government consumption (until 2010 a Hungarian national classification by purpose was used).

Basic prices are used for measuring output and purchasers' prices for intermediate consumption. In government and NPI sectors cost basis is used. Final use of GDP is measured at market (purchaser's) prices. Owner occupied dwellings are valued at cost basis. Exports of goods are valued at f.o.b. and imports of goods are valued also at f.o.b.

With the integration of SUT introduced in 2011, balancing became a regular task. From now and on, this is the final stage of the whole process of GDP estimation. For 2008 (benchmark year), statistical discrepancy was eliminated in the framework of SUT. Statistical discrepancy was eliminated in non-benchmark years in the following way. In case of relatively small discrepancy (in 2009), the whole amount was attributed to changes in inventories (expenditure side). For years before 2008, discrepancy was equally divided into production and expenditure sides (50% each). On the production side statistical discrepancy was attributed to NFC and HH sectors, in proportion to their GVA values at current prices. On the expenditure side it was allocated to final consumption expenditure of

households and gross fixed capital formation, in proportion to their value weights in GDP before balancing. The residual amount was allocated to changes in inventories.

## **Expenditure Approach**

Estimation of household final consumption expenditure is based on two main data sources: the household budget survey and the retail trade survey which both have been processed quarterly and annually.

Total government consumption expenditure data are based on direct administrative data sources: annual calculations are based on annual reports of government institutions and the final budget report; quarterly calculations are based on monthly or quarterly reports of government institutions.

The main data source is the annual survey on NPISHs conducted by HCSO.

Estimates of gross fixed capital formation (GFCF) are based on quarterly statistical surveys which include imports of capital goods, use of domestic capital goods and information from housing statistics. The quarterly surveys refer not only to the new assets but for the used ones, as well.

The main sources to estimate the annual GFCF are the Structural Investment Survey, within the Structural Business Statistics, the balance sheets of corporations with less than five employees, and enterprise data on stocks of tangible fixed assets. Data on new dwelling constructions in physical volume terms (number and square meter) from permits of put into operation are available.

Changes in inventories are fully based on the quarterly survey.

Exports and imports of goods were based mainly on the monthly customs declarations for goods until May 1, 2004. Since then, Intrastat and Extrastat statistical systems are used. For the foreign trade in services, the data were derived entirely from the balance of payments statistics until 2004. Since then survey data are used (collected by HCSO) for the foreign trade of business services and tourism surveys (conducted by HCSO) data are used for estimation of tourism expenditure. The other foreign trade services were derived from the balance of payments statistics until 2004. From 2005 the data are based on surveys of HCSO.

Household final consumption expenditure is obtained mainly from the household budget survey and retail sale survey and used both for the direct level estimates and as an indicator for the changes in the level of total household consumption expenditure. For the quarterly constant price estimates, the expenditures at current prices are deflated with the CPI, at COICOP four digit level.

- Government final consumption expenditures at current prices are based on administrative data sources from government institutions. Constant prices are calculated using data of labour force statistics, productivity indices, producer-price indices and consumer-price indices.
- Gross fixed capital formation (GFCF) is estimated from quarterly GFCF surveys of public and private corporations and budgetary institutions. Estimates on value of own-account construction by households is based on information on the number of dwellings built. GFCF at constant prices is calculated by deflating the current values using a price index for gross fixed capital formation, derived from construction, foreign trade and industrial price surveys.
- For exports and imports of goods the Intrastat and Extrastat statistical systems are used with no adjustments for shuttle trade or smuggling. Constant price estimates are derived by deflation using quarterly export and import price indices based mainly on actual export and import prices. An exchange rate index is used to deflate exports and imports of services and expenditures of resident households abroad. Non-residents' consumption expenditure in Hungary is deflated by the CPI.

## **Income Approach**

Compensation of employees is estimated from tax declarations of corporations, income tax declarations, SBS, labour surveys, financial data for general government and social security statistics. Taxes and subsidies on products are taken directly from the general government accounts. Operating surplus is to be found in the national

accounts as a residual of production. Compensation of employees and other taxes on production are deducted from gross value added and other subsidies on production received are added. Mixed income is a residual item in household sector. Consumption of fixed capital is obtained by using PIM for fixed capital. There is no constant price calculation for income elements.

## Production Approach

Calculation of GDP is based to a great extent on the Business Register (BR). The BR contains every unit with tax number.

Besides the Business Register, the compilation of accounts for the non-financial corporations sector is mainly based on an own-developed enterprise database called KABtar. This database is essentially built on corporate profit tax returns, but it integrates data coming from other data sources (e.g. statistical surveys, budgetary data and other tax declarations) in a determined way.

The main data sources of the financial corporations sector are tax declarations, data collected by the Hungarian Financial Supervisory Authority for other monetary institutions, insurance companies and pension funds.

Every general government unit in legal terms is a non-market producer and classified into the general government sector in NA. However, in the central or local government the budgetary institutions can be market producers. As they are not independent producers, they are considered as the local KAUs of the central and local government organs and the SS funds. They remain classified into the sector but their output is calculated on the basis of the sales revenue. Public corporations and public non-profit institutions are classified into GG on the basis of criteria as defined in ESA 2010. For corporations classified into this sector, the data is calculated from the same sources, which are used in case of corporations classified into the non-Financial corporations sector: the corporate profit tax return and the SBS.

The households sector, in line with ESA 2010, covers the households both as consumers and producers. The Households sector accounts for the production of sole proprietors with licence and other permission. The sources to estimate the figures of sole proprietors are the Business Register; the database of tax returns of personal income tax, value added tax (VAT) and simplified corporate income tax; and the final, anonymous, individual results of value added tax audits of sole proprietors for the period 2006-2008.

The data sources of non-profit institutions serving households sector are the following: statistical survey on non-profit organisations; statistical survey on churches; financial statements by political parties published in the Hungarian Official Journal. The output of the NPISHs is compiled on a cost basis.

## Iceland

### Source

Response to the National Accounts Questionnaire from Statistics Iceland, Reykjavik.

The data provided to UNSD is received through the Organisation for Economic Cooperation and Development (OECD), Paris.

### General

From September 2014, these national accounts estimates are compiled according to the 2008 SNA ('System of National Accounts 2008', Commission of the European Communities-Eurostat, International Monetary Fund, Organisation for Economic Co-operation and Development, United Nations and World Bank, 2009).

The financial intermediation services indirectly measured (FISIM) are allocated to industries and institutional sectors.

Original chain constant price estimates are referenced to 2015.

### Methodology:

#### Overview of GDP Compilation

Gross domestic product is estimated mainly through the expenditure approach. The production approach is used in estimating GDP by kind of economic activity as well as cost-structure of GDP as described below.

#### Expenditure Approach

All components of gross domestic product by expenditure type are estimated through the expenditure approach. Government final consumption expenditure is mainly based on government accounts. Estimates of private consumption expenditure are based on various sources. A vital source is the import of consumer goods plus import duties and trade and transport margin. The Agricultural Production Board is the source for the estimate of consumption of domestically produced agricultural products. A considerable part of the consumption of services is derived from the Industrial Statistics and the continuous Household Expenditure Survey which is used as a weight in consumer price index.

Gross capital formation is mostly based on investment statistics from the Enterprise Accounts Register, direct inquiries to the main constructors, information about residential construction from the Land Registry of Iceland and government accounts. Exports and imports of goods and services are estimated from foreign trade statistics and balance of payment statistics. Price deflation is used for most of the expenditure items in arriving at constant prices. Various price indices are used.

#### Production Approach

The production approach is used to estimate both cost-structure of domestic product and gross domestic product by kind of activity. The main source is the Enterprise Accounts Register. From 1997 onwards it has been compulsory for incorporated enterprises and unincorporated enterprises (from 2001) to return standardized annual accounts to the tax authorities. In addition to the Enterprise Accounts Register information from the VAT Register and the Pay-as-you-earn Register are used for control and grossing up. In cases where the accounting rules are not in accordance with the National Accounts standard appropriate adjustments are made to the accounts. For the constant price estimates the general approach for almost all industries is the deflation of the gross output or extrapolation of base year value of output. Double-deflation is not used in any industry.

<sup>a</sup> Statistical discrepancy between net lending (+)/net borrowing (-) in the financial account and net lending (+)/net borrowing (-) in the capital account.

## India

### Source

Response to the United Nations national accounts questionnaire from the National Accounts Division of the National Statistical Office (NSO), Ministry of Statistics and Programme Implementation, New Delhi. Official estimates are published annually in the "National Accounts Statistics".

### General

The estimates shown in the following tables have been prepared in accordance with the System of National Accounts 2008 (SNA 2008). The estimates relate to fiscal year beginning on 1st April. NSO has introduced the new series of National Accounts Statistics with base year 2011-12 in place of the previous series with base year 2004-05. The changes made in terms of concepts, definitions, procedures and sources of data are given in the publication "Changes in Methodology and Data Sources in the New Series of National Accounts, Base Year-2011-12", released by NSO in June 2015. The publication is also available on the website [http://www.mospi.gov.in/sites/default/files/press\\_releases\\_statements/Changes%20in%20Methodology%20NS%202011-12%20June%202015.pdf](http://www.mospi.gov.in/sites/default/files/press_releases_statements/Changes%20in%20Methodology%20NS%202011-12%20June%202015.pdf)

### Methodology:

#### Overview of GDP Compilation

Gross Value Added (GVA) is estimated mainly through the production approach for agriculture and a combination of production and income approaches for the other sectors, as detailed below:

1. Estimates of agriculture (including livestock), forestry and fishing sector are prepared using production approach. The production estimates of principal agricultural crops are based on administrative records which give crop acreage statistics and the results of the crop-cutting surveys conducted by the respective state government agencies which give the yield estimates. The ex-farm prices are used to evaluate the total production of each commodity. The annual estimates of livestock products are based on the livestock population by type and the corresponding average yield rate of estimate through the annual integrated sample survey conducted by the state government agencies. Estimates of production and prices in respect of forestry and fishing sectors are also provided by the state government agencies. Intermediate consumption is estimated by using a variety of sources such as the cost of cultivation studies conducted by the central government, sample surveys conducted by National Sample Survey Office (NSSO), marketing reports and other administration based statistics. The constant price estimates are prepared using base year prices.
2. Estimates for mining, manufacturing and services are prepared using enterprise approach. The main data sources employed are budget documents, annual reports of public and private sector companies, annual survey of industries covering large scale manufacturing establishments and sample surveys of the unincorporated and unorganised manufacturing and service enterprises carried out by NSSO.
3. Estimates of pucca construction are compiled by the commodity flow approach using data on steel and cement production, foreign trade statistics, customs and excise revenue, etc. The estimates of kutcha construction (from locally available materials) are based on expenditure data from government budget, NSSO debt and investment surveys and other sources.
4. Ownership of dwellings: The GVA for the ownership of dwellings of urban dwellings is equivalent to gross rental of the residential census houses less the cost of repair and maintenance. For these dwellings, rent per household for the base year are obtained from consumer expenditure survey while cost of repair and maintenance is taken from All India Debt and Investment Survey. For years subsequent to the base year, rent per household as in the base year is extrapolated using the index of house rent (urban areas) and the number of dwellings is extrapolated using the inter-censal growth rate of urban dwellings. Cost of repair and maintenance for the subsequent years is obtained by moving the base year estimate with Net Capital Stock. Gross rental for rural dwellings is estimated

through user cost approach, using the capital stock of rural residential buildings.

Constant price estimates:

Constant price estimates of GVA in respect of agriculture, etc. are prepared using base year prices whereas in other cases constant price estimates are obtained by deflating the current price estimates by appropriate price indices or extrapolating the base year estimates with quantum indices.

Other aggregates are compiled using expenditure and income approaches as detailed below:

## **Expenditure Approach**

The expenditure approach is used to estimate government final consumption expenditure, change in stocks and exports and imports of goods and services. The commodity-flow approach is used to estimate private final consumption expenditure whereas the estimate of gross fixed capital formation is based on both commodity-flow and expenditure approaches.

Estimates of government consumption expenditure are mainly obtained from budget documents and annual reports of the government bodies.

Estimates of private expenditure on goods are obtained from the estimates of production adjusted for change in stocks and foreign trade and reduced by intermediate consumption and government final consumption and by the quantities used for capital formation. Private expenditure on services is estimated as the value of the total output for each kind of service reduced by the estimated expenditures on service consumed/ used by government and the business.

Estimates of change in stocks for the public sector and organized private industries are based on government budget documents and annual accounts and reports of industries respectively. Estimates of change in stocks of unorganized private industries are based on sample survey data, data on bank advances and margins and on livestock censuses.

Gross fixed capital formation estimates are compiled using data from a number of sources such as government budget documents, annual reports of private sector companies, foreign trade statistics, customs and excise revenue statements, all India debt and investment survey, enterprise survey, annual survey of industries, co-operative societies data and capital expenditure on plantation data from NABARD.

The estimates of exports and imports of goods and services are based on balance of payment statistics.

For the constant price estimates, change in stocks of livestock, mining and food grains are valued at 2011-12 prices. For government expenditure, private expenditure on services, increase in stock for other sectors, gross fixed capital formation, exports & imports, the current values are deflated by relevant price indices or unit value indices (in case of exports and imports).

Final consumption expenditure of NPISH is included in that of households.

## **Income Approach**

Estimates of compensation of employees and operating surplus are based on budget documents, annual financial reports of enterprises and sample surveys. Consumption of Fixed Capital is estimated for each industry separately on the basis of estimated value of capital stock and the expected age of various types of assets at the aggregate level by following the perpetual inventory method. The sources include the All-India debt and investment surveys, livestock censuses, budget documents and annual accounts. Estimates of taxes and subsidies on production are based on accounts and annual reports of government bodies.

## Production Approach

The table of gross domestic product by kind of economic activity is prepared at basic prices. The production approach is used to estimate value added for all commodity producing sectors and moving the benchmark estimates for unregistered manufacturing. Value added of construction is based on a combination of commodity-flow and expenditure approaches. A combination of production and income approaches are used for all other sectors.

The production estimates of principal agricultural crops are based on administrative records which give crop acreage statistics and the results of the random sample crop-cutting surveys conducted by the respective state government agencies which give the yield estimates. The wholesale prices in the primary markets are used to evaluate the total production of each commodity. The annual estimates of livestock products are based on the livestock population by type and the corresponding average yield rate of estimate through the annual integrated sample survey conducted by the state government agencies. Intermediate consumption is estimated by using a variety of sources such as the cost of cultivation studies conducted by the central government, the National Sample Survey Organization (NSSO), the All-India debt and investment survey, marketing reports and other administration based statistics.

Estimates of the gross output of minerals are based on data available from the Indian Bureau of Mines and the state governments.

For large-scale manufacturing, estimates are prepared for 20 industry groups based on the Annual Surveys of Industries (ASI). Benchmark estimates for the household and non-household unregistered manufacturing and other unorganised portions of trade, transport etc. are prepared using data on value added per worker derived from the follow-up surveys of economic census of CSO and NSSO and estimated working force. For other years, estimates are extrapolated by means of indicators of physical output or input and prices.

Estimates of pucca construction are compiled by the commodity flow approach using data on steel and cement production, foreign trade statistics, customs and excise revenue, etc. The estimates of kutcha construction (from locally available materials) are based on expenditure data from NSSO, debt and investment surveys and other sources.

For public sector trade, transport, administration, banks etc., estimates are based on the analysis of budget documents and annual accounts.

The estimates of gross rents for urban and rural dwellings are based on the number of dwellings and estimated gross rental value per dwelling obtained from the NSSO surveys on consumer expenditure.

For the constant price estimates, double deflation is used for the agriculture and mining sectors. Current values of large-scale manufacturing and construction are deflated by price indexes. For unregistered manufacturing, electricity, gas and water, trade, transport, ownership of dwellings and other services, value added is extrapolated by quantity indices. The economic activities relating to private households with employed persons are covered under other community, social and personal services. Current price estimates of public administration are deflated with the consumer price index of industrial workers to obtain the constant price estimates.

## Indonesia

### Source

Response to the United Nations national accounts questionnaire from BPS-Statistics Indonesia, Jakarta. Official estimates are published annually in the "National Accounts Statistics".

### General

With the rebasing of the GDP from base year 2000 to 2010, Indonesia implemented the 2008 SNA, in order to capture the current economic conditions. Furthermore, this is in line with the recommendations of the United Nations, using the Supply and Use Tables (SUT) as framework.

### Methodology:

#### Overview of GDP Compilation

Gross domestic product is estimated through two approaches: production and expenditures. The difference between both approaches (statistical discrepancy) is put as a component in the expenditure side. In line with the base year change, new classification of industries and components are also applied.

#### Expenditure Approach

The expenditure approach is used to estimate private final consumption expenditure, government final consumption expenditure, exports and imports of goods and services.

Private final consumption expenditure is estimated using Socio-Economic Survey (Susenas) data combined with data from a quarterly survey on household and NPISH consumption.

The commodity-flow approach is added to estimate some commodities in gross fixed capital formation.

The main sources of data for the estimation of central government consumption expenditure are the budgetary accounts of the Department of Finance, while local governments provide data are collected by BPS-Statistics Indonesia.

Various secondary data are used to estimate gross fixed capital formation. For gross fixed capital formation referring to buildings and structures, the indicators of imports of construction materials.

Benchmark values are extrapolated by quantity indicators of domestic production and volume.

Benchmark data for capital formation are based on statistics of imports and domestic production of construction materials, machinery and equipment. Import of machineries and equipment are obtained from import statistics, while domestic production is compiled by using production and implicit price indices to extrapolate the benchmark estimates. Other years' estimates are extrapolated by quantity and price indices of other years' estimates are extrapolated by quantity and price indices of domestic production and imports of construction materials. Estimates of exports and imports of goods and services are obtained from foreign trade and balance of payment statistics.

For the constant price estimates, current values of private expenditure items are deflated by the consumer price index, government expenditure items are deflated by the consumer price index and by the wholesale price index. Values of exports and imports are deflated by the corresponding unit value price indices.

#### Income Approach

Consumption of fixed capital for manufacturing, electricity, gas and water, is estimated from information available at the CBS. For other sectors the estimates are based on the results of special surveys. The main sources of data

for net indirect taxes are the budgetary accounts of the central and local governments. Compensation of employees are taken from the receivers side (household). Operating surplus is obtained as a residual.

## **Production Approach**

The production approach is used to estimate value added of most of the industries.

Industry of agriculture, food crops production is compiled on the basis of information relating to area harvested and average yield for each crop obtained from the BPS-Statistics Indonesia. Coverage of agricultural output treat Cultivated Biological Resources (CBR) and Work-in-Progress (WIP) as recommended in the 2008 SNA. The prices used are based on farm-gate prices obtained from annual surveys. Production of commercial and estate crops, livestock, forestry, and fishery are obtained from the departments concerned. For main food crops, commercial and estate crops, livestock, forestry, and fishery the value of intermediate inputs is based on cost-structure surveys.

The most important mining commodity is crude petroleum for which production data are available for all enterprises concerned. Estimates of prices and input costs are compiled on the basis of returns furnished by the largest firm. For the base year 2010, data on supply and use structure of manufacturing have been compiled for each industry group from statistics maintained by the BPS-Statistics Indonesia and from surveys and other studies undertaken. For other years, industrial production indices are compiled on the basis of output of selected manufactured products.

Output of industry of electricity, gas, and ice production and output of industry of water supply, sewerage, waste management and remediation activities are estimated using the production approach.

For the output of industry of construction, the information on imports of construction materials are obtained from commodity imports statistics whereas estimates of domestically produced materials are based on the annual industrial surveys.

Output of industry of trade is estimated on the basis of the commodity flow approach, and is calculated by multiplying estimates of the producers' values of the marketed surplus of agricultural products, domestically produced manufactured goods, selected mining and quarrying products and the cost of imported goods by the percentage distribution mark-ups gathered from special surveys. Estimates for other years are extrapolated by a quantity index of marketed surplus traded and an implicit price index.

Output of industry of transportation and storage and output of industry of information and communications are estimated using the production approach.

Output of industry of accommodation and food service activities is estimated using the production approach; production indicator uses room occupancy rates and price indicator uses average rates per night room. Output at current price is calculated by production value / income from manufacturing survey and annual report of go public firms.

The information of output and value added of the financial industry are based on the data compiled annually by the Bank of Indonesia and Financial Services Authority (FSA).

Basic data relating to industry of real estate and business activities are limited and rough procedures are adopted by using information gathered from the special surveys.

For government services, estimates are obtained from current budget expenditure and information furnished by local bodies.

<sup>a</sup> Includes Furnishings, household equipment and routine maintenance of the house

<sup>b</sup> Includes Education.

<sup>c</sup> Includes Communication.

<sup>d</sup> Data for this year(s) have not been revised and therefore, may not be consistent with its components in this table and with corresponding data in other tables. Refers to general government final consumption expenditure.

## Iran (Islamic Republic of)

### Source

The National Accounts Department of Central Bank of the Islamic Republic of Iran provided notes on methodology and data reflected in the tables. These estimates are published in the annual bulletin "Bank Markazi Jomhuri Islami Iran, Economic Report and Balance Sheet". The following tables have been prepared from successive replies to the United Nations National Accounts Questionnaire.

### General

The estimates shown in the following tables have been prepared in accordance with the concepts and definitions of System of National Accounts 2008 (2008 SNA). Previously the estimates were prepared in accordance with the United Nations Systems of National Accounts 1993 (1993 SNA). Detailed data as well as description of sources and methods used for national accounts estimation will be published in the latest volume of the National Accounts of Iran, 2011-2018. Input-output tables have been compiled for the years 1965, 1969, 1973, 1984, 1999, 2004, 2010 and 2016. When, for conceptual or statistical reasons, the scope and coverage of the estimates differ from the definitions and classifications recommended in the SNA, a footnote is indicated to the relevant tables.

### Methodology:

### Overview of GDP Compilation

Gross domestic product is estimated mainly through the production approach.

### Expenditure Approach

The expenditure approach is used to estimate all components of gross domestic product by expenditure type except gross fixed capital formation in machinery which is calculated mainly by commodity-flow approach. Estimates for government final consumption expenditure are based on records from all sectors of general government. Private final consumption expenditure is estimated using data from family budget surveys. The estimates of gross fixed capital formation in private construction are derived from annual surveys on construction. The data on investment in construction by the public sector is obtained from the accounts of different government units. The capital formation in machinery and equipment is estimated through commodity-flow approach using information on domestic production, imports and exports of capital goods. The estimates of exports and imports of goods and services are obtained from the balance of payments accounts and foreign trade statistics. For the constant price estimates, all items of gross domestic product by expenditure type are deflated by appropriate price indices.

### Income Approach

The estimates of compensation of employees are obtained in the process of estimating value added by industrial origin. Consumption of fixed capital is estimated according to useful lifetime of different type of capital goods. Operating surplus is obtained as a residual. Estimates of indirect taxes and subsidies are based on government accounts.

### Production Approach

Before the introduction of the 1993 SNA, the table of gross domestic product by kind of economic activity was prepared at factor values. The production approach is used to estimate the value added of most industries. The income approach is used for producers of government services, financial services and part of other services.

The agricultural estimates are based on annual surveys of agriculture, carried out by Ministry of Agriculture. The estimates are checked using the results of the annual households surveys. Data on the production of red meat are based on surveys implemented by ministry of agriculture on slaughter houses in urban area. Statistics concerning forestry and fishing are obtained from concerned agencies.

Mining estimates are based on annual sample surveys and the Census of Mining. The value added of oil sector is derived from the reports of the Ministry of Oil.

The manufacturing estimates for large establishments which employ 10 workers or more are based on the results of the annual surveys of manufacturing. For small establishments, estimates are derived using the sample surveys and information from other sources.

The estimates of electricity, gas, steam and air conditioning supply are based on information obtained from financial statements of concerned corporations and other sources.

The estimation of water supply, sewerage, waste management and remediation activities is based on the information from financial statements and other sources as well.

Estimates for private construction in the urban areas are obtained from the results of CBI's annual surveys with adjustments made to cover contractors' profits which are not included in the surveys. For the rural areas, the results of households Survey by the Statistics Department of Central Bank, investment on dwelling survey by Housing Foundation and the loans information from Agricultural Bank have been applied.

For trade sector, the gross margin is calculated using the results or survey of wholesale and retail trade in the urban areas.

Estimates for transport sector are generally based on the sample surveys by Central Bank of Iran and financial statements of related companies and for the storage sector the estimates rely on the Statistics Center Surveys and other sources as well. For the information and communication sector, the estimates are based on the financial statements of the related firms and other sources and also the Business and Services Comprehensive Survey by the Statistics Center of Iran.

The value added of financial institutions and insurance companies is obtained directly from the financial statements of concerned institutions. The estimates for dwellings are based on data obtained from household surveys and imputations are made for owner-occupied dwellings.

For producers of government services, estimates are derived from government accounts.

Estimates for social and personal services are based on information from various sources mainly The Business and Services Comprehensive Survey implemented by the Statistics Center of Iran and Households survey of CBI.

For constant price estimates, the current values are deflated by an appropriate price index for each kind of economic activity.

## Iraq

### Source

The Iraq National Accounts are compiled and disseminated by the National Accounts Department of the Central Statistical Organization (CSO) at the Ministry of Planning. CSO located in Baghdad. The following tables have been prepared from successive replies to the United Nations national accounts questionnaire. The National Accounts estimates are published on the website ([www.cosit.gov.iq](http://www.cosit.gov.iq)), as well as in the Annual Statistical Abstract.

### General

The latest estimates shown in the following tables have been prepared in accordance with the United Nations System of National Accounts 1968 (1968 SNA). Latest Input – Output tables have been published in 2010. When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables. The following illustrates the recent changes and improvements made in the methodology: Estimates for animals products, are based on the new agriculture census 2001. In addition, old coefficients used in the estimation of animal production have been updated based on discussion with officials from the Ministry of Agriculture.

For Other Mining and Quarrying, the results of an establishment survey of the private sector that was conducted on 2003 have been used. For data on Electricity and Water, private production of electricity was included. The imported building materials used by public enterprises have been estimated based on market exchange rate. The results of a survey on road passengers transport conducted on 2003 have been used to update estimates of the related sector. The results of the household income and expenditure survey conducted in 2007 and 2012 are used to estimate the input for ownerships of dwellings.

Public Health & Education has been excluded from the public administration and defence. The imported good of the government have been evaluated based on market exchange rate. The methodology has been changed, and results of the household income and expenditure survey conducted in 2007 are used, replacing the old estimates that were based on the household income and expenditure survey conducted in 2002. New deflators have been used, in particular, volume deflators such as index numbers of manufacturing production, index number of government employees to deflate the current value added of the government activity. The deflators have been updated. GFCF is estimated according to current market prices.

### Methodology:

#### Overview of GDP Compilation

Gross domestic product is estimated mainly through the production approach. Expenditure and income approach are also compiled.

#### Expenditure Approach

Government consumption is estimated from the government accounts. Private household consumption is estimated from the data of the Household socio economic survey. Gross Fixed Capital Formation: all data are obtained from government accounts, public Balance Sheet Accounts, manufacturing surveys, and construction output. Estimates are made for the rest of the activities. Exports and Imports of goods and services data are obtained from Central Bank. Changes in stocks are estimated as residual.

#### Income Approach

The estimates of compensation of employees in the public sector are obtained from the Balance Sheet Accounts of the government and companies. For the private sector, the data are obtained from both service surveys and internal trade surveys. Operating surplus is obtained as a residual. The data on indirect taxes and subsidies are obtained from the actual accounts of the government or from the final accounts of the establishments of the public sector.

## Production Approach

The table of gross domestic product by kind of economic activity is prepared at factor cost. Data on cultivated area, production by crop, and prices are provided by the Agricultural Statistics Department of CSO in cooperation with the Ministry of Agriculture. Intermediate consumption is estimated based on information obtained from administrative data. The output for Fishing is estimated based on quantity sold in the wholesale fish markets of the governorates of Iraq. The Department of National Accounts estimates the quantity sold outside wholesale fish markets and the production for own use. The quantity sold outside wholesale fish markets is estimated 20 % of the quantity sold inside such markets. Production for own use is estimated based on information obtained from the 2007 and 2012 Household Income & Expenditure Surveys.

Oil production is estimated based on volume, quantity and price data provided by the Ministry of Oil. The intermediate consumption is also provided by the Ministry of Oil. For sulphur and phosphate the estimation is based on the profit and loss accounts of the concerned public enterprises. Annual establishment's survey is the source of data to estimate the production account. Large scale establishments (30 employees or more) and medium size (10-29 employees) are covered on complete enumeration while small establishments (< 10 employees) are sampled. The value added is deflated by manufacturing volume production index.

Data source for Electricity and Water are the financial statements and profit and loss accounts of all public companies producing electricity and water. For Transportation, Communication and Storage, the public establishment production accounts are estimated by using annual financial statements. Private transport is estimated based on administrative data obtained from traffic police as well as studies on revenue and cost of vehicle. As for communication, the communication companies provide data to CSO and therefore, are included from the estimates. Private establishments working in storage activity are not included in the estimates.

The source data for public construction sector are the financial statements of public establishments. Private construction sector is estimated using the number of building permits issued by the administrative authorities. CSO conducts an annual survey on a sample of construction sites to measure the actual value of production. In addition, the department adopting fixed ratio to estimate the profit margin of the private sector. The estimations include illegal construction activities (building without permits) based on special studies.

The data source for public sector is the financial statements of publicly owned establishments. Private sector activities are estimated from the annual survey and business services, hotels, reports received from consumer cooperatives. For trade activity the National Accounts Department uses the commodity flow method. The source of data for banks and insurance companies is the Balance Sheet Accounts. The 2007 and 2012 Household socio economic surveys are used to estimate the production accounts of this activity. The government budget is the source of data of Public Administration and Defence.

## Ireland

### Source

Response to the National Accounts Questionnaire from the Central Statistical Office (CSO), Dublin. The official estimates are published in 'National Income and Expenditure', CSO. The data provided to UNSD is received through the Organisation for Economic Cooperation and Development (OECD), Paris.

Detailed methodology of Irish national accounts could be found in Central Statistical Office website: <https://www.cso.ie/en/releasesandpublications/ep/p-nie/nie2019/methodology/>.

### General

The national accounts estimates of Ireland are compiled according to the 2008 SNA ('System of National Accounts 2008', Commission of the European Communities-Eurostat, International Monetary Fund, Organisation for Economic Co-operation and Development, United Nations and World Bank, 2009).

The financial intermediation services indirectly measured (FISIM) are allocated to industries and institutional sectors.

Original chain constant price estimates are referenced to 2019.

### Methodology:

#### Overview of GDP Compilation

Gross domestic product is estimated mainly through the income & expenditure approach.

#### Expenditure Approach

The expenditure approach is used to estimate government final consumption expenditure, increase in stocks, and exports and imports of goods and services. The main sources used in the compilation of Household final consumption include trade and production data in the commodity flow approach, fiscal data from the Revenue Commissioners, Household Budget Surveys and the Census of Population for the rent estimation. Other sources include administrative data and direct inquiries to some of the main public service providers. Government final consumption expenditure is estimated from the accounts of the various government bodies such as the ministries, the local authorities and health boards, extra-budgetary funds and the Industrial Development Authority. The main sources used in the compilation of Gross Fixed Capital Formation are administrative and fiscal data, surveys, direct information and trade and production data in the commodity flow method. Administrative data, direct inquiries (including the Quarterly Stocks Inquiry) and surveys are the main sources used in estimating changes in inventories. The estimates of imports and exports of goods and services are obtained from balance-of-payments, special studies and surveys. For the constant price estimates, direct revaluation at base-year prices is used for items of private final consumption expenditure where quantity data are available. For all other components of GDP by expenditure type, price deflation is used.

#### Income Approach

Compensation of employees is estimated by assigning an income to each person classified as an employee in the labour market statistics derived from the Quarterly National Household Survey (QNHS). The QNHS results are annualised to provide control totals for the numbers of employees in each branch. To convert from the residence basis used in the QNHS to the domestic concept used in the national accounts, an adjustment is made for persons employed by embassies and international organisations. The earnings information used in the calculations is largely derived from statistical surveys and administrative records. The statistical surveys include the Census of Industrial Production and the Annual Services Inquiries. For public sector employees, including most teachers and health service workers, the remuneration estimates are taken from public accounts and from information provided by Government Departments. Operating surplus is calculated from returns made to the revenue authorities and

from government accounts. Depreciation is based on the perpetual inventory method for the agricultural sector. For private enterprises, it is taken as the income tax wear-and-tear and other allowances. Indirect taxes and subsidies are estimated from the government accounts.

## Production Approach

Before the implementation of the 1993 SNA, the table of gross domestic product by kind of economic activity was prepared in factor values. The income approach is used to estimate the value added of all industries except agriculture, for which the production approach is used. Annual estimates of agricultural output are calculated on a commodity basis for crops, livestock and livestock products. The data on quantities and values are obtained from various sources such as Department of Agriculture and Central Statistics Office. The total quantities purchased and amounts paid by the purchasers for important agricultural items such as wheat and barley are available from various inquiries and adjusted for marketing margins and transport costs. For live exports, f.o.b. export value less an allowance for marketing margins, is taken as the output value. For the remaining items market prices are used as the basis for evaluation. Input data are obtained through the Department of Agriculture for fertilizers. Data for seeds are compiled indirectly from acreages and seedling rates. Own-account consumption of food and fuel is evaluated at agricultural prices. For mining, quarrying and manufacturing enterprises employing more than three persons, the estimates are based on annual censuses. Quarterly surveys of turnover and employment are conducted for manufacturing and services. For small-scale manufacturing, the number of persons engaged, which is derived as the difference between population census data and data from the production census, interpolated for intercensal years and projected forward, are multiplied by average income per person. The estimates of electricity, gas and water and of construction are based on annual inquiries. For trade, censuses of distribution provide benchmark data for turnover, purchase of products, wages and salaries and intermediate inputs. For intervening years, monthly turnover figures from a sample of 2,500 establishments are used together with annual estimates of the number of employees and trends in earnings. For restaurants and hotels, annual surveys and revenue data are used. Transport is mainly provided by public enterprises and data are obtained from published accounts. Data obtained from annual reports, direct surveys on wages and salaries and revenue statistics are used for the estimates of the financial sector. For real estate and business services, data from population census, imputed average income and revenue accounts are used. The imputed rent of owner-occupied dwellings is taken as the average rent paid for similar dwellings in similar locations. Estimates of other private services are based on the results of inquiries into wages and salaries and on trends in operating surplus taken from revenue data. Data on government services are obtained from the government accounts. For the constant price estimates, double deflation is used for agriculture. Value added of all other economic activity sectors of GDP is extrapolated by a quantity index.

# Israel

## Source

The preparation of national accounts statistics in Israel is undertaken by the Central Bureau of Statistics (CBS), Jerusalem. The official estimates are published annually by the CBS in the "Statistical Abstract of Israel in the publication "National Accounts 1995-2014" and in the "Current Briefings in Statistics". The CBS publishes also quarterly estimates of the GDP through the expenditure approach in the "Monthly Bulletin of Statistics" in the "Macro-Economic Statistics Quarterly", in the Media Releases and in the Time series – Database of the CBS website ([www.cbs.gov.il](http://www.cbs.gov.il)). The following tables have been prepared from successive replies to the United Nations national accounts questionnaire.

## General

The estimates since 1995 shown in the data tables have been prepared in compliance with the concepts and definitions of System of National Accounts 2008 (2008 SNA). The estimates since 1950-1995 were prepared in accordance with the 1968 SNA.

When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, the differences are explained in footnotes to the relevant tables.

The estimates of the Gross Domestic Product and its components at constant prices are calculated each year, at the prices of the previous year, and presented in the tables as chained estimates at 2015 prices, to allow comparisons between non-consecutive years. Because of chaining, estimates for each category of the GDP do not add up to the total GDP.

## Methodology:

### Overview of GDP Compilation

Gross domestic product is estimated both through the expenditure and production approaches. The expenditure approach is considered more reliable, and thus a statistical discrepancy will balance the GDP estimated from the production approach. Annual series on domestic product by the income approach are also presented, although the aggregate is not obtained independently, since net operating surplus is derived by deducting from the GDP, at basic prices, compensation of employed persons, consumption of fixed capital and other taxes on production (net).

### Expenditure Approach

General government consumption expenditure

The estimates for central government are based on the analysis of the Accountant General's reports, the budget provisions, and complementary data received from the Ministries of Finance and Defence, which provide monthly, quarterly, and annual reports. The quarterly data for the local authorities, national institutions, and non-profit institutions are based on data from alternative sources, mainly the NII's monthly wage data and the Treasury's monthly data on transfers to these institutions. Annual financial and budget accounts of local authorities and related institutions are used to prepare final estimates. Data on number of employees and hours worked are obtained from the ministries' and the NII's wage files and from the quarterly labour force surveys of the CBS. For the constant price estimates, wages and salaries are extrapolated using changes in the labour inputs. Purchases of goods and services are deflated by relevant components of the consumer or wholesale price index.

Private consumption expenditure

The main data sources for the components of household final consumption expenditure are:

- (i) Flow of goods and services are calculated on the basis of monthly data on quantities and consumer prices. The sources for monthly data on quantities are:
  - (a) for meat, fish, eggs, and fruits and vegetables; supply to the local market by the Agricultural Produce Marketing

Board (about 90 % of total supply) and production for own use from agricultural surveys;  
 (b) reports of Israel Electric Corporation (IEC) and fuel companies for electricity and fuel;  
 (c) monthly surveys of the Central Bureau of Statistics (CBS) on the supply of durable goods to the domestic market and person-nights in hotels.

Prices for electricity are obtained from the ISC. Prices for all the other items listed above are taken from the relevant prices collected for the consumer price indices.

(ii) Household expenditure survey (HES) is used for consumption of housing services, business and personal services, part of the food products for which data on quantity marketed are not obtained, and industrial products other than food products or fuel. Since 1997 the HES is conducted annually, in years before that each 5 years until 1992/93. The survey frame is the municipal tax (Arnona) file. Before 1997 the sample represented only urban households, and estimates for non-urban households were added based on the composition of these households. Since 1997 the sample also covers non-urban households. The extrapolation and interpolation are based on indicators, such as domestic sales in the relevant industrial branches according to the new international Standard Industrial Classification (ISIC Rev. 4) obtained from monthly industry surveys (see the summary methodology for production index) conducted by the CBS (around 20% of household consumption); VAT revenues from communication and recreational services; quarterly data on revenues from financial data collected by the CBS covering domestic transport, hotel, postal, private hospital, and broadcasting services; financial data from the Central Bank and banking corporations covering the expenditure of FISIM; financial data from the Capital Market Division of the Ministry of Finance covering the expenditure of life/non-life insurance ; administrative data on floor area of completed dwellings updating the stock of dwellings; monthly data on number of departures and entries of Israeli residents from the Ministry of the Interior; and the import of consumer goods (around 17% of household consumption). The latter is measured on the basis of the classification of imported goods between consumer, capital, and intermediate goods mainly based on the results of the "Import Destination Survey" conducted in 2006, although the destinations for some important goods such as PC's, vehicles have been checked in each year. Relevant components of producer and import price indices are used to derive volume extrapolators, and relevant consumer price indices are used to convert the volume measures into estimates at current prices.

(iii) Direct purchases by foreign residents in the domestic market and by Israelis abroad are obtained from the "Travel" item in the Balance of Payments, after deduction of an estimate for business expenditures.

#### Final consumption expenditure of NPISHs

Data are obtained from an annual survey of NPISHs which covers all NPISHs employing two or more employees. The survey sample includes about 1600 institutions - all large institutions and a representative sample of smaller institutions by purpose, the last survey was for the year 2013. Data on wages reported to the National Insurance Institute (NII) are used to derive preliminary estimates based on the annual survey.

#### Gross capital formation in fixed assets based mainly on the following:

- a. Gross capital formation in construction is calculated basing on quarterly estimates of quantitative data on the area of construction begun, construction completed and average per unit costs; for the general government and public non-financial enterprises, financial data on construction carried out are used.
- b. The estimates of imported machinery , equipment and transportation vehicles are based on the foreign trade statistics using the customs tariff description to identify the relevant items, while estimates of locally produced goods are based on a monthly report of sales by product obtained from a sample of the producers.
- c. Data received from government ministries, public institutions and major enterprises on their investments.
- d. Research and Development survey which estimates the business sector's expenditure on research and development activity.
- e. Estimates of gross capital stock, net capital stock and consumption of fixed capital relate to December 31 of each year. Data are taken from the quarterly system, where yearly estimates of gross capital, gross capital stock and capital stock are data from the fourth quarter of each year, and estimate for consumption of fixed capital is the sum of all quarters for each year.

Estimates of changes in inventories in agriculture, fuel and government strategic stocks are prepared by multiplying quantity changes in inventory stocks by their average prices. Regular quarterly and annual surveys are

used to estimate inventory changes for industry and wholesale trade. The data obtained are adjusted to approximate the value of the physical change in stocks. The estimates of changes in inventories include the value of unsold production (mainly software and R&D) of the start-up companies, estimated on the basis of data on investments of the Venture Capital Funds in these companies. The estimated change in stocks of diamonds is based on the difference between exports and imports at constant prices.

The estimates of exports and imports of goods and services are based on foreign trade statistics and balance of payments data.

## **Income Approach**

Estimates of compensation of employees were obtained by summing up compensation of employees in each industry based on industry surveys such as the Manufacturing Survey. For industries where surveys were not conducted, estimates were based on administrative reports, such as employers' reports to the NII or reports from the Accountant General. The estimate of consumption of fixed capital was calculated using the perpetual inventory method.

## **Production Approach**

The table of gross domestic product by industry is prepared at basic prices. The estimates since 2005 shown in the data tables have been based on the new ISIC (International Standard Industrial Classification of All Economic Activities) Rev. 4. All taxes less subsidies on products are estimated at total economy level only and not by industry.

Agriculture, hunting, and forestry, Fishing - Output from Annual Census of Agriculture carried out by the Ministry of Agriculture and the CBS- Intermediate consumption is estimated (based on imports, domestic supply of fertilizer, etc.) - Wage data from the National Insurance Institute (NII). Preliminary estimates based on Monthly statistics on production of agricultural goods.

For mining and manufacturing (excluding diamond industry) the estimates are based on industrial surveys carried out annually. For years not covered by industrial surveys estimates are interpolated and extrapolated using current production indices. For the diamond industry the estimates, at current and constant prices, are obtained using data on imports and exports of diamonds of the various types. Estimates of the output are calculated for each type of diamond separately.

Estimates for Electricity, gas, and water supply are based on annual financial statements from the electricity company, gas companies, and on revenue data from VAT. Changes of value added, at constant prices, were obtained assuming fixed input-output ratios from the latest input-output table, and using indicators of the output: water output measured at cubic meters and electricity supplied at KWhours.

The estimates for construction are obtained by using the financial and quantitative data on the main components of the industry's output: investments in buildings and in other construction works (roads, pipe lines, railway tracks, cable laying and other building works) and construction for defence purposes. It was assumed that there was a constant ratio between input and output, at constant prices, in the main types of construction.

Estimates for Commerce, restaurants and hotels are based on annual Trade and Services surveys and Hotel surveys. For years not covered by annual surveys estimates are interpolated and extrapolated using current VAT indices, and indicators on tourism, such as Guest-nights in hotels.

Estimates for Transport, Storage and Communications are based on annual Trade and Services surveys. For years not covered by annual surveys estimates are interpolated and extrapolated using financial reports for some industries, VAT indices on revenue, or indicators such as data on kilometers travelled by taxis and trucks, loads hauled by ships, number of passengers in domestic airlines.

Estimates for the financing and insurance industries are based on consolidated reports prepared by the supervisor

of banks and the supervisor of insurance.

Estimates for renting (including imputed rents in own-occupied dwellings) are based on benchmark estimate for residential rent, extrapolated by the change in the value of inventories of dwellings.

For other services, estimates are derived from a sample of income tax files, VAT revenue data and manpower data.

## Italy

### Source

Response to the National Accounts Questionnaire from the Istituto Centrale di Statistica (ISTAT), Rome. The official estimates are published in 'Contabilità Nazionale', ISTAT. The data provided to UNSD is received through the Organisation for Economic Cooperation and Development (OECD), Paris.

Detailed methodology of the Italian national accounts could be found in the ISTAT website:  
<http://www.istat.it/en/archive/110843>.

### General

From September 2014, these national accounts estimates are compiled according to the 2008 SNA ('System of National Accounts 2008', Commission of the European Communities-Eurostat, International Monetary Fund, Organisation for Economic Co-operation and Development, United Nations and World Bank, 2009).

The financial intermediation services indirectly measured (FISIM) are allocated to industries and institutional sectors.

Original chain constant price estimates are referenced to 2015.

### Methodology:

#### Overview of GDP Compilation

Analytical framework: the Italian system of National Accounts is based on the European System of National Accounts ESA 2010, which are derived from the System of National Accounts (2008 SNA). Annual National Accounts data start from 1995.

The economic territory doesn't include: 1) extraterritorial enclaves (the Vatican State and San Marino).

Classifications: Institutional units and transactions are classified according to ESA2010. The classification of the economic activity adopted is the ATECO2007 that is the national version of NACE Rev. 2, coinciding from the 4 digit level up. The CPA is adopted to classify products. Final household consumption expenditures are classified in reference to COICOP; non-profit institution expenditures are classified in reference to COPNI; Government expenditures are classified according to COFOG. Capital formation is classified according to the ANF6 level of ESA2010 (10 items). Foreign trade data are classified according to the Combined Nomenclature (CN).

With reference to the year of estimate considered to be final the classifications adopted are: A64; P64 and two digits level for COICOP, COFOG, and COPNI. For the semi-final and the provisional years more aggregate classifications are adopted.

Valuation: GDP is calculated at market prices; GDP components are calculated at market prices, while value added is calculated both at producer and basic prices. GDP components are published at current prices, previous year's prices and chained-linked volumes. Income aggregates are estimated only at current prices. Both total imports and exports are valued on an f.o.b. basis using the information on insurance and freight for merchandise imports coming from Banca d'Italia.

Annual supply and use tables are used to fully reconcile GDP estimates from the production, expenditure and income approaches. Coherence between demand and supply side estimates is ensured by balancing procedures according to Stone's methodology. In quarterly accounts—in the current year—demand and supply estimates are independent and the coherence of the accounts is guaranteed by obtaining the Changes in Inventories as a balance.

Base year and update cycle: Volume measures are calculated at the prices of previous year. Chained values are also calculated (reference year 2015).

### **Expenditure Approach**

In general, the indicators used in the estimation of quarterly demand components are evaluated at current prices. Chained values are obtained by quarterly disaggregating the annual deflators with the following short-term indicators:

- Household final consumption expenditure: relevant CPI items;
- Gross fixed capital formation: producer prices, unit mean values of imports;
- Changes in inventories: derived as a balance with statistical discrepancies;
- Acquisitions less disposals of valuables : relevant CPI items;
- Exports and imports of goods and services: for goods unit mean values of import/export and import/export prices; for imported services exchange rates and CPI of main partner countries; for exported services domestic CPI and output prices.

### **Income Approach**

Income approach is applied for all the sectors of national economy but it can be considered suitable for the integrated approach to GDP estimates only for specific segments of the economy, namely the estimates of value added produced by non market industries and domestic services. Compensation of employees is estimated through use of the value-added survey and a survey carried out by the Ministry of Labour and Social Security for the industrial sector, minimum contractual wages and survey of the compensation of permanent employees for the agricultural sector, surveys and inquiries carried out by other institutes for the service sector and other indirect evaluation for sectors not covered by surveys. Information on operating surplus is obtained from the value-added surveys and from actual interest received and paid by the various sectors. Depreciation is valued on the basis of time series of gross fixed capital formation at constant prices by product and by branch of economic activity. Constant prices of 1970 are estimated by using the perpetual inventory method, assuming that the devaluation of the product is constant during its economic life. Estimates of indirect taxes and subsidies are obtained from government sources. Taxes linked to production and imports are broken down by branch according to the type of tax. Data on subsidies are classified by branch on the basis of the recipients indicated in the government budgets.

### **Production Approach**

Current and previous year's prices: the quarterly production side aggregates, as well as the annual ones, are estimated with the double deflation method. Concerning quarterly estimates, it consists of the following steps:

1. quarterly disaggregation of production data at current prices by means of quarterly indicators in nominal terms;
2. deflation of production by means of output prices, obtained by weighted averages of producer/consumer and export prices; computation of production at previous year prices;
3. quarterly disaggregation of chained value added using, as an indicator, the production obtained in step 2); computation of value added at previous year prices;
4. calculation of intermediate consumption at previous year prices as difference between production of step 2 and value added of step 3; computation of chain-linked values;
5. quarterly disaggregation of intermediate consumption at current prices by means of a derived nominal indicator obtained from chain-linked values of intermediate consumption of step 4 times input prices.

<sup>a</sup> Statistical discrepancy between net lending (+)/net borrowing (-) in the financial account and net lending (+)/net borrowing (-) in the capital account.

## Jamaica

### Source

National accounts for Jamaica are compiled and disseminated by the Statistical Institute of Jamaica. Annual national accounts estimates are disseminated in the annual publication "National Income and Product" report. Quarterly GDP estimates are disseminated quarterly in the publication "Quarterly Gross Domestic Product." Data on GDP are also disseminated on the website [www.statinja.gov.jm](http://www.statinja.gov.jm) and on the National Summary Data Page (NSDP).

### General

The Jamaican System of National Accounts is based on the United Nations System of National Accounts 1993 (1993 SNA). The concepts and definitions generally conform to 1993 SNA standards. In a few instances however there have been variations due to local conditions or the unavailability of adequate data. The Jamaican system does not include the full range of information recommended in the 1993 SNA. Included in this system are:

1. Accounts of the nation
  - Gross domestic product by expenditure and income
  - Generation and use of disposable income
  - Capital accounts
  - Rest of the world accounts

2. Gross value added by industry

3. Supply and use tables and input/output tables

4. Tourism satellite account (TSA)

The national accounts cover all resident units, including enterprises operating in the free zones. Indirect estimates are made for most categories of informal production and includes some form of illegal activity. However due to data constraints the illegal drug trade is not included. In principle, all transactions are recorded on an accrual basis, except for receipts and outlays of general government, which are on a cash basis. All transactions in goods and services are recorded at market prices. Output is recorded at basic prices, domestic expenditures at purchasers' prices, while imports and exports are valued f.o.b.

Economic activities of producer units are classified according to the Jamaica Industrial Classification (JIC 2005), which in turn is based on the third revision of the International Standard Industrial Classification of All Economic Activities (ISIC, Rev. 3). The 12 major activities used in the dissemination of national accounts statistics are:

- Agriculture, Forestry and Fishing;
- Mining and Quarrying;
- Manufacturing;
- Electricity and Water;
- Construction;
- Wholesale & Retail Trade; Repairs; Installation of Machinery & Equipment
- Hotels and Restaurant;
- Transport, Storage and Communication;
- Financing and Insurance Services;
- Real Estate, Renting and Business Activities;
- Producers of Government Services;
- Other Services

For national accounts purposes, the Harmonized System Classification used in the foreign trade statistics in respect of imports and exports of merchandise is converted to the Standard International Trade Classification

(SITC), Rev. 4. The classification system used for the estimation of household consumption is the Classification of Individual Consumption by Purpose (COICOP).

Gross value added at constant prices are prepared only by the production approach. The base year for the constant prices is 2007. The estimates are calculated at the five digit product group level and then summed to arrive at total gross value added for the economy. Estimates at constant price are derived by the single deflation method and involves the extrapolation of base year gross value added using volume indicators. These can be estimated from:

- the deflation of gross output by some appropriate price index
- physical quantities

The first estimates of national accounts are produced and disseminated six months after the end of the reference (calendar) year. Two subsequent revisions are prepared and the accounts are considered final after the third revision. The accounts however are open for further revision if new and revised data become available.

The quarterly GDP estimates are produced and disseminated three months after the end of the reference quarter. Estimates for each quarter are revised when those for the subsequent quarters of the same calendar year are released. Estimates of the previous years are revised only at the time of the second quarter estimates.

## **Methodology:**

### **Overview of GDP Compilation**

GDP estimates based on the three approaches are consolidated on the Gross Domestic Product and Expenditure Account. The tables do not reflect statistical discrepancies as adjustments are made to the Private Final Consumption Expenditure and changes in inventories. Supply and use tables are prepared every three years and assist in the reconciliation of the estimates.

#### **Quarterly Estimates:**

The preparation of quarterly GDP by economic activity constant prices incorporates the use of quarterly indicators to extrapolate GDP by economic activity. The estimates are derived from quantity indicators or value indicators, which are deflated by appropriate price indices. Trend extrapolation is also utilized when there are no available indicators. The data are benchmarked using XLPBM to the annual estimates and seasonally adjusted using the X13 ARIMA programme. The main data source for quarterly GDP by economic activity in current prices is administrative data and quarterly national income survey. The data are benchmarked to the annual estimates but not seasonally adjusted.

### **Expenditure Approach**

The principal sources for estimating GDP by the expenditure approach are:

- Quarterly and annual sample surveys of establishments
- General Consumption Tax (GCT) data
- Household Expenditure Survey
- Survey of Living Conditions
- Labour Force Survey
- Government accounts and other administrative data
- External Trade Statistics
- Balance of Payments data

Government Final Consumption Expenditure: The estimates are computed as Gross Output, less sales.

Private Final Consumption Expenditure: A commodity flow approach is used to estimate final private consumption expenditure. With the commodity flow approach, all goods are assigned an end-use, based on whether they are used as consumer goods, raw material or capital goods. Account is taken of any item having more than one end

use. This end use assignment is based on the United Nation's Classification by Broad Economic Categories (BEC). The estimation process takes account of only those goods classified as consumer goods. Estimation is made item by item as the sum of the retail value of local production and the adjusted c.i.f. value of imports. The basic data on local production are obtained from the production approach. The COICOP classification is used.

**Gross Fixed Capital Formation:** Gross fixed capital formation is also estimated by a commodity flow method. Estimates for construction materials, machinery, vehicles, and other equipment are made in terms of the value of retained duty-paid imports plus local production less estimated value of goods used for repair and maintenance and for personal and household purposes, plus estimated dealers' margin, transport costs and installation costs. The value of capital goods produced locally is obtained from output data using the production approach. Estimates of intangible fixed assets are also included using data from the production accounts and the balance of payments. Gross fixed capital formation is estimated by type.

**Increase in inventories:** This is estimated on the basis of sources described under the production approach. The accounting method of the reporting establishment is accepted and no attempts are made to arrive at a revaluation of inventories.

**Imports and Exports of Goods and Services:** Both exports and imports are valued f.o.b. Merchandise import and export data are obtained from the trade statistics. Trade in services data are obtained from the balance of payments estimates compiled by the central bank.

For Constant prices, relevant consumer price indices (CPI) are used for Household Final Consumption; export and import unit value indices and relevant price indices are used for Exports and Imports of Goods and Services; Gross Capital Formation is deflated using import unit value indices and appropriate PPI and CPI of major trading partners adjusted for exchange rate; Government Final Consumption is deflated using relevant wage indices and CPI.

## **Income Approach**

Compensation of employees is estimated from the results of the National Income Survey, financial statements of companies from tax records, and the Labour Force Survey. Consumption of fixed capital is based on unadjusted estimates of depreciation from the survey and tax records. Taxes on production and imports are obtained from monthly statements of government revenues and the annual estimate of Revenue and Expenditure of Central Government and Departments. Subsidies are estimated by a detailed review of government subsidy and transfer expenditures. Included in subsidies are grants on current account to government enterprises in compensation for operating losses that are clearly consequences of the policy of the government to maintain prices at a level below cost of production. Operating surplus/mixed income is a residual estimate and no distinction is made between operating surplus and mixed income.

## **Production Approach**

Data from a wide variety of sources are used in the compilation of the GDP by activity. The main data source is the Annual National Income Survey that is administered to a sample of establishments. All establishments employing fifty or more employees and twenty per cent of establishments with ten to forty-nine employees are included in the sample. Information from this survey is used to compile the production and generation of income accounts for each product group in an industry. The estimates are calculated at the five digit level of the JIC. In addition, data from administrative records, financial statements of establishments, merchandise trade, population and housing census and a variety of household surveys are included in the statistics. It should be noted that basic sources, particularly in the services sector, are adjusted to take account of the informal sector. GDP by the production approach is calculated as the sum of the value added of all industries plus taxes less subsidies on products. The value added of an industry is the gross output (at basic prices) less intermediate consumption (at purchasers' prices).

Some producer units are not captured through the basic data gathering mechanisms. These include

- informal sector production

- production of households for own final use
- underground production
- illegal production

Alternate methods are therefore used to estimate gross value added. The following are some of the methods used:

- Supply based methods – data on the supply of inputs such as labour are used to estimate output.
- Demand based methods – production is determined by using indicator data on specific uses of a good or service
- Commodity flow method – this method involves balancing total supplies and uses of individual products.

## Japan

### Source

The preparation of national accounts in Japan is undertaken by the Economic and Social Research Institute of the Cabinet Office (former Economic Planning Agency), Tokyo. Official estimates are published in "Annual Report on National Accounts." The data for Japan was received through the Organization for Economic Co-operation and Development (OECD), Paris.

### General

The latest estimates shown in the following tables have been prepared in accordance with the concepts and definitions of the System of National Accounts 2008 (2008 SNA). Previously, the estimates were prepared in accordance with the United Nations System of National Accounts 1993 (1993 SNA). Whenever the scope and coverage differ for conceptual or statistical reasons from the definitions and classifications recommended in 2008 SNA, footnotes are indicated to the relevant tables.

The following presentation of sources and methods is mainly based on information from "Methodology of Compiling National Accounts in Japan" published by the Economic and Social Research Institute (in Japanese). Input-output tables have been published by the Ministry of Internal Affairs and Communications (former Management and Coordination Agency).

Please note that Annual financial accounts are still compiled according to 1993 SNA.

Data in the quarterly financial and non-financial accounts are also available according to the SNA 2008.

Japan has revised its annual national accounts at the beginning of 2012. Revised series shown here have been linked backwards with former series to obtain time series without break.

The financial intermediation services indirectly measured (FISIM) are allocated to industries and institutional sectors.

Original chain constant price estimates are referenced to 2015.

### Methodology:

#### Overview of GDP Compilation

Gross domestic product is estimated mainly through the expenditure approach.

#### Expenditure Approach

Using the commodity flow method, output by market producers, intermediate consumption, household final consumption expenditure, gross capital formation, exports and imports are estimated for each of approximately 2,000 commodities. Shipment estimates are derived directly or indirectly from statistics such as Crop Survey, Census of Manufactures, Current Production Statistics Survey, financial statements. Distribution channels and coefficients such as the distribution ratios, transportation fee rates, and trade margin rates are decided for each of the commodities based on the information of the Input-output Table for the benchmark year (currently, CY2011), with those for subsequent years adjusted through the balancing process between expenditure approach and production approach using Supply and Use Tables. Services produced by non-market producers (i.e. general government and private non-profit institutions serving households (NPISHs)) and those demands are estimated separately based on the settlement of accounts of governments, and on the Survey of Private Non-profit Institutions and other sources. Gross domestic product (expenditure approach) is obtained by adding up final consumption expenditure, gross fixed capital formation, change in inventories, and net exports. Exports and imports are estimated by rearranging the Balance of Payments Account.

For household final consumption, quarterly figures are estimated by distributing the calendar-year figure into quarterly figures: this benchmarking is conducted for both supply side and demand side. Supply-side figures are estimated by a simplified commodity flow method (the number of commodities are aggregated into 91). Demand-side figures are estimated by the source data such as the Family Income and Expenditure Survey. For gross fixed capital formation, quarterly figures are estimated in the same way as final consumption expenditure of households. Sectoral figures for gross fixed capital formation are estimated by breaking down the calendar-year figures estimated by the commodity flow method, on the basis of sectoral figures estimated through the expenditure approach, which uses settlements of accounts of government, Financial Statements Statistics of Corporations by Industry and so on. For Changes in inventories, quarterly estimates are compiled by using the source statistics such as Index of Industrial Production, Current survey of commerce, and Financial Statements Statistics of Corporations by Industry. Gross domestic product in real terms is estimated by the chain-linked method (reference year: 2011). The minimum unit of price indexes is called a basic unit deflator, which corresponds to the approximately 400 commodities aggregated from the approximately 2,000 commodities used for the commodity flow method. Series in real terms are obtained by dividing the nominal values of the 400 commodities by the basic unit deflators for each demand item. In other words, real values are estimated using a chain-weighted Paasche-type deflator weighted by 400 commodities. Final consumption expenditures of general government and NPISHs in real term are estimated using deflators by activities that correspond respectively to nine activities of government and five activities of NPISH.

### Income Approach

Wages and salaries are estimated separately for the three groups of agriculture, forestry and fisheries, government services, and other industries. Concerning the other industries, quarterly cash allowances to employees by industries are calculated by multiplying the per-head wage by the number of employees. In this case, the number of employees is based on the "Population Census" conducted every five year and is interpolated midway through the five-year period by trends observed from the "Labor Force Survey," while the cash allowances per head are mainly based on the "Monthly Labor Survey." Cash allowances to officers are estimated by multiplying the number of officers by the difference between the per-head allowances of both officers and regular employees, which are estimated from the source statistics such as Financial Statements of Corporations by Industry, Population Census, Economic Census, and the per-head allowances of regular employees. Employers' contributions to social security schemes are estimated on the basis of the operational reports of these schemes. Employers' contributions to other social insurances are estimated by using the financial statements of corporations and the operational reports of each social insurance scheme. The operating surplus is estimated through a production approach (value-added method) as a balancing item derived by subtracting Compensation of Employees, Taxes on production and imports and Consumption of fixed capital from value added. Consumption of fixed capital is estimated by perpetual inventory method (PIM) under declining-balance model where depreciation rate for each commodity is estimated using the source information such as Survey on capital expenditures and disposals of private enterprises. Taxes on production and imports and subsidies are estimated on the basis of settlements of accounts of central and local governments.

### Production Approach

The gross domestic product by type of economic activity is prepared at market prices, i.e. producers' values. The output of each of the 90 industry groups (belonging to market producer) is estimated from the "V" table (a make matrix for commodity output by economic activity), of which the output value by each commodity is given by the commodity flow method. The intermediate input of each industry group is estimated from the "U" table (a use matrix for commodity input by activity): for the benchmark year, this table is compiled from the quinquennial Input-output Table and the "V" table for the year in question, and for the mid-year, the table compiled from "V" table and the information on cost structure obtained from various source statistics for each year. The intermediate input is adjusted through the balancing process between production approach and expenditure approach using Supply and Use Tables. The value added by industry are estimated by subtracting the intermediate input from the output. The output, intermediate input, and value added by non-market producer (i.e. general government and NPISHs) are separately estimated by using the settlement of accounts of government, survey of private non-profit institutions, and other sources. Gross domestic product by industry in real term is estimated by the double

deflation method. Output by the chain-linked method (reference year: 2011) is estimated from the "V" table in real terms, which is obtained by dividing the output of each commodity by its output deflator. The intermediate input by the chain-linked method (reference year: 2011) is estimated from the "U" table in real term, which is obtained by dividing the intermediate input of each commodity by its input deflator.

<sup>a</sup> Excludes the statistical discrepancy between expenditure-based and production-based GDP amounts. Refers to Value Added, Gross.

<sup>b</sup> Discrepancy between the Total Economy and the sum of the domestic sectors.

<sup>c</sup> Discrepancy with equivalent item in Table 1.1 (Gross domestic product by expenditures at current prices).

<sup>d</sup> Statistical discrepancy between net lending (+)/net borrowing (-) in the financial account and net lending (+)/net borrowing (-) in the capital account.

## Jordan

### Source

The preparation of national accounts statistics in the Hashemite Kingdom of Jordan is undertaken by the Department of Statistics (DoS), Amman. The following tables have been prepared from successive replies to the United Nations National Accounts Questionnaire. The most recent data have been provided by the Department of Statistics. The annual national accounts statistics are published in the annual Yearbook and on the DOS website - [www.dos.gov.jo](http://www.dos.gov.jo).

### General

The annual official estimates together with methodological notes are published in a series of publications entitled "National Accounts". A comprehensive description of the concepts and definitions underlying the various tables is contained in "The National Accounts 1976-2002", published in 2004 by the Department of Statistics. The estimates are generally in accordance with the classifications and definitions recommended in the United Nations System of National Accounts 1993 (1993 SNA).

The DoS compiled "Input-output tables, 2006" which were published in 2010; the tables include 81 sectors for the Jordanian economy.

### Methodology:

#### Overview of GDP Compilation

Gross Domestic Product is estimated mainly through the production approach.

#### Expenditure Approach

All components of Gross Domestic Product by expenditure type are estimated separately except private consumption expenditure which is estimated residually.

The estimates of government final consumption expenditure are obtained from the records of the Ministry of Finance, Independent Agencies and municipalities.

Estimates of Gross Fixed Capital Formation are obtained from the data of the economic and agricultural surveys which are conducted annually by DoS; other data are taken from different government budgets.

Estimates of changes in inventory depend on the same sources used for Gross Fixed Capital Formation. Export and imports goods data are compiled by DoS. These data are compiled using information from custom forms provided by the Department of Custom, and aggregated by the DoS. Export and import services data are provided by the Central Bank, these data are also utilized in balance of payment tables.

Gross domestic product by expenditure at constant prices is not estimated.

#### Income Approach

The sources and methods applied in estimating the cost-structure by components of gross domestic product are based on the breakdown of income estimates obtained from the annual surveys.

All items in this approach are calculated depending on the previous sources mentioned and other government sources, except for Net Operating Surplus, which is estimated as a residual.

## Production Approach

The estimates of gross domestic product by kind of economic activity are compiled at basic prices. The production approach is used to estimate the value added of all industries, they are:

- Annual agricultural sample surveys are undertaken on a country-wide basis providing production estimates for crops. The quantities obtained from these surveys are valued at farm prices collected from the farmers through a monthly survey. Livestock estimates are obtained through sample surveys covering the organized farms and unorganized sector.
- DoS conducted a general establishments census for all economic activities for 2011. The last census was conducted in 2006 which provides frames for all economic surveys:
- Annual industry survey is the source of the data for, mining and quarrying, manufacturing, and electricity activities.
- The annual construction survey covers the organized sector; which utilizes formal contractors, whereas the estimate of unorganized sector is based on the complementary quarterly survey whose sampling frame comprises all newly licensed buildings obtained from the Building Licenses Census. A stratified random sample is created, stratified on the basis of cost.
- Annual internal trade survey covers wholesale and retail trade activity. Data for hotels and restaurants sector is derived from annual services survey.
- The transport activities are covered through two surveys; the first survey covers the organized sector which includes all establishments performing the activities of road, sea, air transport, in addition to post and telecommunications. The second survey covers unorganized sector which includes goods shipment and passengers transport.
- Annual financial and insurance survey collects data to estimate the financial and insurance activities, while business services data is derived from services survey, finally real estate data comes from household expenditure survey.
- Annual services surveys cover all other services activities.
- Gross domestic product by kind of economic activity at constant prices is estimated with a base year 1994; the base year will be updated after the completion of the census of establishment which is currently being conducted.
- The Double Deflation method is used, to obtain the constant price estimates by deflating the values of both gross output and intermediate consumption separately. But in the cases where it is impossible to use double deflation due to lack of convenient price indices to deflate the intermediate consumption, other methods were applied, such as extrapolation method in which the intermediate consumption of 1994 was extrapolated using gross output at constant prices as volume indicator.

# Kazakhstan

## Source

Response to the United Nations national accounts questionnaire from the Bureau of National Statistics of the Agency for Strategic Planning and Reforms of the Republic of Kazakhstan (hereinafter referred to as the Bureau). The Bureau compiles and distributes the National Accounts of the Republic of Kazakhstan. The latest data for Kazakhstan was received through the United Nations Economic Commission for Europe (UN/ECE).

## General

The estimates shown in the following tables have been prepared in accordance with the concepts and definitions of the System of National Accounts 1993 (1993 SNA). When the scope and coverage differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables.

Currently, the Bureau is working on the implementation of the provisions of the international standard of the System of National Accounts 2008 (2008 SNA), adopted by the EU Commission, the International Monetary Fund, the Organization for Economic Cooperation and Development, the United Nations, and the World Bank.

Most transition economies went directly from the Material Product System (MPS) to the 1993 SNA and did not implement the System of National Accounts 1968 (1968 SNA). Please note that the official currency of Kazakhstan has changed in 1993 from the Russian ruble to Kazakh tenge. One tenge equals 500 Russian rubles (see World Bank "Statistical Handbook for the States of the FSU, 1996"). Data in series 150 and 200 for 1990-1992 (1990-1993 for data at constant prices) were compiled in Russian rubles and converted to tenge. Starting 1993 (1994 for data at constant prices), data were compiled in tenge.

## Methodology:

### Overview of GDP Compilation

The GDP in Kazakhstan is calculated using three approaches: Production approach, Expenditure approach and Income approach. The production approach is the main method for compiling GDP in Kazakhstan.

Current price valuation is performed in the system at prices used in operations. Production and use of GDP are valued at current market prices prevailing in the period to which production or use of the product belongs. To eliminate the impact of different tax and subsidy rates in various sectors of the economy on the structure of production and income generation, sectoral indicators are estimated at basic prices.

Revaluation in comparable (previous year) prices is carried out both for the gross domestic product produced and for the indicators of its use. The reassessment of GDP production indicators in comparable prices is carried out by extrapolating data for the base year in current prices by volume indices. To reevaluate indicators of GDP use into comparable prices, relevant price indices (consumer price index, capital investment price index, etc.) are used. GDP deflator index - the ratio of GDP computed in current prices to the volume of GDP computed in comparable prices of the previous period.

The GDP in production approach and Income approach is calculated quarterly and annually. The GDP breakdowns by kind of economic activities are classified in accordance with the General classification of economic activities (OKED), which is harmonized with European Classification of Activity NACE Rev. 2., as well as by economic sectors on an annual basis according to the Classification of Economic Sectors (CSE).

## Expenditure Approach

Gross Domestic Product by the expenditure approach is obtained by the sum of final consumption expenditures, gross capital formation and net exports.

Final consumption expenditure consists of final consumption expenditure by households, the general government (GSS) and non-profit institutions serving households (NPISH).

Household final consumption expenditures consists of expenditures on consumer goods and services, goods produced for their own consumption and housing services produced by homeowners for their own final consumption. Since 2013, an estimate of the costs of goods and services produced in the framework of illegal activities has been included.

DGS final consumption expenditures represent expenditures on goods and services provided to households free of charge or at economically insignificant prices, include non-market output of DGS, the cost of goods and services purchased by DGS from market producers to provide households and non-market output of the National Bank of the Republic of Kazakhstan. The classification of expenditures on final consumption of SSU is carried out in accordance with the Classification of functions of government bodies and is published in the context of expenditures for individual and collective services.

Final consumption expenditure by NPISH is expenditure on goods and services provided to households free of charge or at economically insignificant prices, calculated as the non-market output of NPISHs plus the value of goods and services purchased by NPISHs from market producers to provide to households.

Gross capital formation includes gross fixed capital formation and changes in inventories. The value of gross fixed capital formation is estimated based on the total value of fixed assets acquired by manufacturers (less sold) in the reporting period, plus some increase in the value of non-produced assets that occurred because of the productive activities of institutional units.

Change in inventories includes an increase (decrease) in materials, work in progress and goods.

Net exports represent the balance between exports and imports of goods and services. The balance of exports and imports of goods and services is the result of foreign economic transactions in the form of exports and imports of visible goods, services of a material and intangible nature.

## Income Approach

GDP by income approach reflects primary income: compensation of employees, net taxes on production and imports, profits, and mixed income. The GDP by income approach consists of income components as categories of primary income received by resident institutional units in the process of production of goods and services. The income generation account is compiled for the economy, by sector and by type of activity. In the resource part of the account, the value of gross value added (GVA) is recorded. The GVA value is transferred from the production account. The following costs of value added by producers are reflected in use: wages paid to employees employed in the production process; net taxes on production and imports minus subsidies. The balancing item of the generation of income account is gross profit and gross mixed income, which are reflected on the use side. Production and import taxes include taxes on products and other taxes on production.

The sources of information for calculating GDP by the income method are data from national statistical observations of the Bureau of National Statistics and administrative data of the Ministry of Finance of the Republic of Kazakhstan.

## Production Approach

Gross output is the output of goods and services, representing the total value of goods and services resulting from the production activities of resident units of the national economy in the reporting period. It includes unobservable

economic activity. The calculation of the output is made on the data from industry statistics (statistical enterprises surveys) and administrative data of state bodies such as the Ministry of Finance of the Republic of Kazakhstan, the National Bank of the Republic of Kazakhstan, etc.

Intermediate consumption includes the value of goods and services consumed as inputs in the production process, excluding fixed assets, consumption of fixed capital.

Intermediate consumption includes the following items of expenditure:

- material costs (goods and material services).
- payment for non-material services.
- expenses for business trips in terms of payment for travel and hotel services.
- other elements of intermediate consumption.

Gross value added is the value of gross output minus the value of intermediate consumption, which is an indicator of the contribution to GDP made by individual producers, industries, or sectors of the economy. The volume of value added by industry is calculated in basic prices. The valuation of value-added considers the output of financial intermediation services (FISIM).

For the production-based GDP estimate, the sources of data include statistical forms of the Bureau of National Statistics, and administrative data of the Ministry of Finance, the National Bank and other state bodies.

## **Overview of the Compilation of the Integrated Economic Accounts**

The national accounts of Kazakhstan currently include the following sequence: production account, generation of income account, distribution of primary income account, secondary distribution of income account, use of disposable income account, capital account and financial account. There is a statistical discrepancy between the balancing item of the capital account and the corresponding figure in the financial account. The net lending / borrowing of the financial account is adjusted according to the net lending / borrowing of the capital account.

National accounts are developed in the context of the following institutional sectors: non-financial corporations sector; financial corporations sector; public administration sector; the household sector; the sector of non-profit organizations serving households.

The distribution of institutional units by sectors of the economy is carried out in accordance with the classification of sectors of the economy, in the compilation of the legislation and economy of Kazakhstan. To reflect transactions with non-resident units, the rest of the world account includes data from the Balance of Payments of the Republic of Kazakhstan. Sources of information for compiling a sequence of accounts are data from national statistical surveys, data from the state budget, state social insurance fund, social health insurance fund, unified accumulative pension fund; data on the activities of the financial sector, formed by the National Bank of the Republic of Kazakhstan.

In recent years, the approaches to the formation of the financial account of Kazakhstan have been significantly changed. Since 2012, the financial account has been formed in accordance with the 2008 SNA. The financial account tables have been expanded by subsector of the economy according to the 2008 SNA. The financial corporations sector is divided into eight subsectors, and the general government sector into three subsectors. For the financial account, a three-dimensional table of financial flows by positions and sub-items of all financial instruments broken down by sectors and subsectors of the economy has been compiled.

## Kenya

### Source

The national accounts are compiled and disseminated by the national accounts section of the Kenya National Bureau of Statistics. The official estimates are published annually in the "Economic survey" and "Statistical Abstract". Sources and methods from National Accounts Statistics Kenya could be found at [www.knbs.or.ke](http://www.knbs.or.ke). The following tables have been prepared from successive replies to the United Nations national accounts questionnaire.

### General

The latest estimates are prepared generally in accordance with the concepts, classifications and definitions recommended in the United Nations System of National Accounts 2008 (2008 SNA), which was adopted in 2010. A historical revision of the statistics based on 2008 SNA was carried out back to 2006 and the base year was changed from 2001 to 2009. For the first time, the Supply and Use Tables (SUT) are included as an integral part of the National Accounts Statistics. The Supply and Use Tables provides detailed information on the production processes, the interdependencies in production, the use of goods and services and the generation of income in production.

Previously the estimates were prepared in accordance with the 1993 SNA and 1968 SNA. A full revision of previous estimates for the years 1996-2004 were published in 2005. This revision aligned the overall structure of national accounts statistics to 1993 SNA guidelines to the extent the data available could allow but with a few exceptions. A full revision of previous estimates for the years 1972-1975 were published in 1976, implementing improved methods and sources of estimation (1968 SNA). Input-output tables for 1967 and 1971 were published in 1972 and 1976 respectively in "Input-Output Tables for Kenya". When the scope and coverage of the estimates differ for conceptual or statistical reasons from the definitions and classifications recommended in SNA, a footnote is indicated to the relevant tables.

Data are presented in millions of Kenya shillings.

### Methodology:

#### Overview of GDP Compilation

Gross domestic product is estimated mainly through the production approach. Expenditure and income approach are also compiled. None of the approaches is compiled independently. The revised national accounts are now based on International Standard Industrial Classification of All Economic Activities Revision 4 (ISIC Rev. 4).

#### Expenditure Approach

The components in the expenditure approach are: private consumption (expenditure by households and NPISH), government consumption expenditure, gross fixed capital formation, changes in inventories (value of physical changes in stocks) and exports of goods and services; imports of goods and services. The expenditure approach has been combined with the product flow method, which starts with estimates of the supply of products in purchasers' prices and proceeds to estimates for categories of expenditure expressed in purchasers' prices. Private final consumption expenditure (PFCE) refers to the final consumption expenditure of households and NPISH including the final consumption expenditure of resident households abroad but excludes the expenditure of non-resident households locally. The level and structure of household consumption - a benchmark for 2006 - is based on the household consumption data of the KIHBS 2005/06.

Output for own consumption, all household consumption, is calculated for agricultural and animal products, fish, fuel wood, water collection, and owner occupied dwellings. Changes in inventories are measured by the value of the entries into inventories less the value of withdrawals and the value of any recurrent losses of goods held as inventories. The estimates of changes in inventories cover only a few products, petroleum products among them.

The data sources for the estimation of exports and imports of goods are foreign trade statistics, and informal cross border trade (ICBT) survey. The source of data for estimation of exports and imports services is the balance of payments (BOP) statistics.

Estimates of consumption of fixed capital at constant prices have been developed using the Perpetual Inventory Method (PIM). Various lifespans have been assumed for the different fixed assets; 40 years for dwellings, non-residential buildings, and other structures; 8 years for transport equipment, 10 years for other machinery and equipment; and 5 years for ICT equipment. The lifespan is then used together with stock of the assets to compile the consumption of fixed capital.

## Income Approach

Wages and salaries paid in most industries are obtained from the annual surveys of employees and self-employed persons. Other sources include the integrated rural survey for small farms, logger licenses and wage rate for forestry, reports and special surveys for transport, government accounts for the government sector and annual questionnaires for the private non-profit services. Information on indirect taxes and subsidies is obtained from concerned enterprises and from government records. Operating surplus, including consumption of fixed capital, is obtained as a residual.

## Production Approach

The Kenya National Bureau of Statistics (KNBS) maintains a central register of establishments (the business register). Regarding economic activities, the revisions in the transport and communication was informed by the expenditure data obtained from Kenya Integrated Household Budget Survey (KIHBS) as well as expanded coverage in the information and telecommunication industry. In manufacturing activities, the revision was mainly supported by improved source data derived from Census of Industrial Production. Real estate activities registered the largest upward revision due to significant increase in stock of high quality dwellings (modern dwelling), higher inter-census annualized growth rate of 6.9 per cent in 2009 compared to 4.7 per cent from the previous 1999 census and more accurate estimates of average rentals. The new stock of dwellings and inter-census annualized growth rate are based on the 1999 KPHC and 2009 KPHC while the previous estimates were based on the 1989 KPHC and 1999 KPHC. Agriculture and forestry also contributed significantly to the upward revision on account of new data sources from Cost of Agriculture Survey, livestock census data from 2009 KPHC, and consumption data from the 2005/06 KIHBS. In addition, agriculture benefited from refined assumptions based on the International Livestock Research Institute (ILRI) and Inter-Governmental Authority on Development (IGAD) reports. However, wholesale and retail trade was revised downwards on basis of new data from survey of trade margins conducted in 2010.

**Agriculture, forestry and Fishing:** Agriculture is estimated to contribute the largest share of GDP at nearly 25 percent. At the compilation stage, estimates are made for the following detailed level of economic activities: growing of crops, farming of animals, support activities to agriculture, forestry and fishing. Livestock production is measured from returns compiled by department of Livestock Production. Forestry and logging estimates have been compiled for the national government, Kenya Forestry Services and the household activities of firewood collection for the following products: Hardwood and soft wood, firewood and charcoal, non-wood forest products and support services to forestry. Output of the national government and Kenya Forestry Services are computed as sum of costs based on the government's books of accounts and the financial statements, respectively. For constant prices, the government salary index is used to deflate the compensation of employees while implicit deflator derived from the SUT structure is used to deflate the intermediate consumption. **Fishing:** Marketed output both at current and constant prices, for fish and other fishing products are based on data from the Fisheries Department on fish landed by quantities and values. Constant prices are derived using catches of the four major categories as volume indicators. Intermediate consumption is assumed to be 15% of output (at constant prices) and reflatd using the implicit deflator from the SUT structure.

**Mining and quarrying:** The estimates are based on production obtained from the Department of Mines and Geology and Ministry of Energy. Base year estimates of intermediate consumption are derived from Census of Industrial Production (CIP) for formal sector and KIHBS for informal sector. The base year ratio of IC to output is

applied for the other years and the IC deflator is used to establish a backward and forward series.

**Manufacturing:** The manufacturing activity is compiled for 30 industries and 49 products. For most industries the annual estimates have been done as follows: a benchmark estimate of output for 2009 (the base year) was computed based on Census of Industrial Production (CIP). The census was conducted in 2010 and collected data for 2009 on output, inputs, employment, compensation of employees, gross fixed capital formation and inventories among other variables. The ratio of intermediate consumption over output, for constant prices, is also estimated on the basis of the CIP. A product flow is compiled for each product. The main departure from the ISIC REV 4 classification is that the processing of tea and coffee have been treated as manufacturing as opposed to being considered as minor processing of agricultural products. The repair of ships and aircrafts are also included as per ISIC recommendations.

**Electricity generation and supply:** The industry comprises the production, transforming, transmission and distribution of electricity. There are two major enterprises, Kenya Power and Lighting Company (KPLC) and Kenya Electricity Generating Company (KenGen) as well a number of independent power producers (IPPs). The value added for this industry is estimated by subtracting the cost of intermediate consumption or inputs (such as fuel cost recoveries for electricity generation and distribution, and non-fuel inputs) from the gross value of output, which is the sum of sales of electricity to domestic users and exports. The output of the IPPs that supply electricity to the national grid is estimated from electricity sales to KPLC. The SUT is used to derive a benchmark value for the intermediate consumption, based on data from KPLC and KenGen which is then moved by fuel power generation costs and output at constant prices. To generate constant price estimates the current price IC for fuel inputs is deflated by IC deflator for fuel and similarly for nonfuel inputs with a generate IC deflator that excludes fuel.

**Water supply; sewerage and waste management:** The national accounts have separately compiled the accounts for two industries; water supply and sewerage and waste collection and treatment, to get aggregate output for this activity. Sewerage and waste management output is estimated using the CIP as a benchmark for market producers and data from local authorities and water boards are used to arrive at nonmarket output. The KIHBS 2005/06 is used to estimate the output of household enterprises that are water vendors. The average CPI services is used to deflate both the market and non-market output. The IC deflator, based on the SUT is used to arrive at constant price value for IC. Output for own final consumption (collection of water) is based on the population censuses 1999 and 2009 and the KIHBS.

**Construction:** The estimates for the industry at current and constant prices are based on the product flow approach. Imports sorted by Broad Economic Categories (BEC) include a category for industrial supplies, among which goods mainly used for input in construction have been identified. This is recorded as intermediate consumption by market producers with deduction of intermediate consumption by central government. Supply from domestic producers originates mainly in quarrying and certain sub-sectors of manufacturing. The ratio of value added over intermediate consumption is based on the Census of Industrial Production (CIP). Compensation of employees is based on the annual employment and earnings statistics. Output and intermediate consumption at constant prices are derived by deflation, mainly using the building cost index.

**Wholesale and retail trade, repairs:** Output is calculated as the sum of trade margins in the product flows both at current and constant prices. The trade margins are based on the results of a survey (Survey of Trade Margins) that was conducted in 2010 and collected the percentage trade mark-ups for the sale of motor vehicle and motor vehicle parts, wholesale trade, and retail trade. The appropriate margins are applied to the marketed products at the product flow level to determine the output for this industry. Intermediate consumption is estimated on basis of the KIHBS and ISS benchmarks which are then extrapolated using the output at constant prices. Output of repair services is based on a supply and use tables. For the formal sector, intermediate consumption is estimated at 40 per cent of output. Estimates of the intermediate consumption for the informal sector are based on a benchmark from the KIHBS. The benchmark is then extrapolated using the total number of motor vehicles operating on Kenyan roads. Current price estimates are then computed by reflating using CPI services.

**Transport and storage:** The sector's output has been estimated separately for the twelve industries and

subsequently aggregated for activity output. However, it can be broadly grouped into five divisions: land transport and transport via pipelines, water transport, air transport, warehousing (and support activities for transportation), and postal and courier activities. Land transport and transport via pipelines include railway, passenger road transport, freight transport by road and transport via pipelines. Railway: output and intermediate consumption are derived from annual reports of Rift Valley Railways. Output is derived from total revenue including receipts for passenger and cargo transportation. Intermediate consumption current price is deflated by the IC deflator for constant prices. Passenger road transport: output estimates are based on benchmark from 2005/06 KIHBS from which expenditures on various modes of passenger transport are used to calculate output. The CPI for various fares have been computed and used to arrive at constant price estimates. Freight transport by road: the output is estimated on the basis on the number of licensed lorries, trucks and heavy vans and estimates of average revenue per vehicle and month. Output at constant prices is moved with sales of diesel transport margins at constant prices. Current prices are derived by reflation using CPI for transport. Transport via pipelines: the output of this industry is estimated as revenue of the Kenya Pipeline Company (KPC) with intermediate consumption derived from operating expenses. A volume index of throughput of crude petroleum is deflating current price output and intermediate consumption to get constant prices values. Water transport: Output for water transport is estimated from returns from the Kenya Ports Authority (KPA). A 2009 benchmark estimated for 2009 is derived from the sum of Integrated Survey of Services (ISS) revenue data for private water transport operators (such as boats) and moved by volume of exports to derive constant prices. These are then reflat by an average of CPI for services and diesel. Intermediate consumption at benchmark is assumed to be a ratio (30 per cent) of the output. The benchmark constant price IC value is moved by output at constant and reflat by the IC deflator for current prices. Air transport: The output of air transport is estimated from turnover data of Kenya Airways with the benchmark of 2009 from the ISS. Warehousing and support activities for transportation: The industries include warehousing, storage and cargo handling. A 2009 benchmark for output and intermediate consumption ratios are obtained from the ISS and Value Added Tax (VAT) data for these industries. Postal and courier activities: The aggregates for postal and courier industries are estimated separately. Output and intermediate consumption for postal services is derived from the income statement of the sole provider of the service, Postal Corporation of Kenya.

Accommodation and food service activities: Hotels; Output is derived by multiplying the room nights by occupancy rate and average room rates estimated from data collected in the monthly survey of hotel and restaurants. The constant values are derived the same as current but using the base year room rates. Informal (households); Output is derived from the household enterprise module of the KIHBS for both accommodation and food and beverages. Accommodation is about 20 percent of the total output of the informal sector. Output at current prices is extrapolated using VAT sales for accommodation and food and beverages services. Output at constant prices is derived by deflating current prices with the respective CPI components (CPI-accommodation services and CPI-food and beverages services). Intermediate consumption; at constant is derived as a ratio of output (from KIHBS) while the current is derived by reflat with the implicit deflator.

Information and communication: The activity covers publishing, audio-visual and broadcasting activities, recording and publishing of music, telecommunications, and IT and other information service activities. The adoption of ISIC REV 4 implies that publishing activities are now part of this classification from manufacturing.

Financial and insurance services: The sector is categorized into five industries; central banking, other monetary intermediation, other financial service activities, insurance, reinsurance and pension funding, and activities auxiliary to financial service and insurance activities, included in these industries are the activities of commercial banks, non-bank financial institutions, the Central Bank of Kenya (CBK), micro-financing institutions, forex bureaus, insurance companies, brokers and agents, insurance regulatory authority, and Savings and Credit Cooperatives (SACCOS). The primary data sources for the activity are mainly administrative records from the supervisory authorities (both private and public financial corporations). These include the Central Bank of Kenya (CBK), Insurance Regulatory Authority (IRA), and SASRA.

Real estate activities: Estimates have been compiled for dwelling services and other real estate services. Dwelling services: Estimates have been done for both market and non-market output (ownership of dwellings). Actual rentals: the 2009 Kenya Population and Housing Census collected data on stock of dwelling units by type of

ownership and tenure. Intermediate consumption at constant is derived from input/output structure generated from the Integrated Survey of Services (ISS) for the base year. Current price estimates are derived by reflating the constant price estimates by the implicit deflator (weighted average of implicit deflator of all inputs for dwelling services). Real estate services except dwellings: Benchmark estimates were developed on basis of the SUT, i.e. total intermediate consumption of real estate rentals. Secondary output of real estate services from other industries is also estimated from the SUT. Output of the real estate industry is then derived as the difference between the SUT estimate and the secondary output of the other industries. The constant price estimates are extrapolated using the gross capital stock of other buildings. The current estimates for real estate industry are generated by reflating by CPI actual rentals paid by tenants.

Public administration and defence: Total output for governments is valued as the sum of production costs; that is cost of intermediate goods/services, compensation of employees and consumption of fixed capital. Constant price values calculated by deflation with the IC deflator for intermediate consumption and a government salary index for compensation of employees, Consumption of fixed capital is calculated at constant prices applying the perpetual inventory method and the reflated by the implicit deflators for GFCF.

Education: Education services are provided by both the government and the private sector in Kenya.

- Pre-primary and primary education: Private; the production account is derived from the National Education Account which has details on enrolment, average fees per student/pupil, and intermediate consumption. Output at constant is then derived by deflating current using the respective CPI (education and accommodation services). Intermediate consumption at constant price is taken as a ratio (27 per cent) of output based on the national education account. The constant price intermediate consumption is then reflated using an implicit deflator to get the IC at current price. Government; Output at current prices is calculated as the sum of intermediate consumption, compensation of employees and consumption of fixed capital (for the national government only) from the government books of accounts. Output at constant prices is derived from enrolment numbers while the intermediate consumption is deflated using the implicit deflator.

- General Secondary Education: Private: the production account is compiled the same way as for the private pre-primary and primary schools with the enrolment, average fees per student, and intermediate consumption being those of the secondary schools as derived in the national education account. Output at constant prices is then derived by deflating current using the respective CPI (secondary tuition and secondary boarding fees). Intermediate consumption, at constant prices, is taken as a ratio of output (base year). The constant intermediate consumption is then reflated using an implicit deflator to get output at current prices. Government; Output at current prices is calculated as the sum of intermediate consumption, compensation of employees and consumption of fixed capital computed from the government's books of accounts. Output is deflated using CPI pre-primary-tuition while the intermediate consumption is deflated using the implicit deflator.

- Technical and Vocational Education: Private; output is derived as average unit cost (for registration, tuition and boarding fees) multiplied by the enrolment. The unit cost is based on the national education account. Output for education services is deflated using CPI-secondary tuition while output of boarding services is deflated using CPI-secondary boarding fees. The intermediate consumption at constant is taken as a ratio (52 per cent) of output based on the Integrated Survey of Services (ISS). Public; output is computed as a sum of costs: compensation of employees, intermediate consumption and consumption of fixed capital based on the government's books of accounts. The compensation of employees is deflated using the government's salary index while the intermediate consumption is deflated using the implicit deflator.

- Higher education: Private; output is compiled for teaching and boarding services using enrolment and unit costs per student for teaching and boarding. The compilation assumes that 70 per cent students are boarders. Intermediate consumption is taken as a ratio (28 per cent) of output at constant and then reflated using the implicit deflator to derive the intermediate consumption at current prices. Public; output is compiled for teaching, boarding and non-education activities based on data from the public universities financial statements. Public universities also receive grants from the national government which are treated as subsidies in the national accounts.

- Other education; these are activities of general continuing education and continuing vocational education and training for any profession.

Health and social work: Human Health Government; public health facilities are operated by both national and county governments. For general government, estimates have been compiled for national government, county

governments and parastatals. Output is valued as the sum of its costs of production as follows:

Output = Intermediate consumption + Compensation of employees + Consumption of fixed capital

The net operating surplus is by convention assumed to be zero.

To derive the output at constant prices, compensation of employees is deflated using the government salary index while the intermediate consumption is deflated using the implicit deflator. For the parastatals, consumption of fixed capital is deflator the implicit deflator. Social work Activities of social work include the provision of a variety of social assistance services directly to clients. These activities are mainly carried out by non-profit institutions serving households (NPISH). Estimates of output are derived as sum of costs of intermediate consumption, compensation of employees and consumption of fixed capital.

Arts, entertainment and recreation: Estimates have been compiled for the private sector, NPISH and the Kenya Wildlife Services (KWS). For the private sector, output is compiled from the VAT turnover and CPI is used to derive the output at constant prices. The financial statements of the KWS have been used to provide data on output, intermediate consumption and compensation of employees. For NPISH, output is derived as sum of costs. Implicit deflators, government salary index and CPI have been used as deflators.

Other service activities: Activities of membership organizations: A benchmark for the 2009 output was derived from the ISS and employment and earnings statistics. Current price output is extrapolated by earnings to the estimates for the other years. CPI is then used to deflate in order to compute constant price output. Intermediate consumption is also compiled from the ISS then for the private sector is derived as a ratio of the output at constant price. For NPISH, output is derived as the sum of costs. The compensation of employees and intermediate consumption are extrapolated by employment numbers. Repair of computers, personal and household goods: For the formal sector, a 2009 benchmark was computed from the ISS and employment and earnings data. KIHBS is used to compute a 2009 benchmark for the informal sector. The sum of the two outputs is then moved with VAT turnover for these activities. CPI for all services is used to deflate current price estimates to constant prices. The intermediate consumption for both formal and informal sectors are derived as a ratio of output at constant prices then reflat using implicit IC deflator to get the current price values. Other personal service activities: The estimates are based on the ISS and employment and earnings datasets. Included here are laundry, salon and barber shop, massage and funeral services.

# Kiribati

## Source

Response to the United Nations national accounts questionnaire from the Planning Office, Ministry of Finance, Tarawa.

## General

The estimates shown in the following tables have been prepared in accordance with the United Nations System of National Accounts 1993 (1993 SNA) so far as the existing data would permit. It should be noted that the estimates for 1972-1974 include data for Tuvalu (former Ellice Islands).

The national accounts statistics for Kiribati is produced on an annual basis. However, the current estimates are limited to Gross Domestic Product (GDP) at current and constant 2006 prices, using the production approach – i.e. GDP (P), and current price Gross National Income (GNI). The GDP estimates are compiled and disseminated at a broad industry level, based on the International Standard Industry Classification, Revision 2 (ISIC Rev. 2).

The previous coverage of economic activity was largely restricted to the formal sector. With the exception of copra cutters production, commercial fishing, and owner-occupied dwellings, most household and informal sector economic activities are not covered. As a result, the previous estimates significantly underestimate GDP (P). The current estimates however reviewed the 2006 HIES results and tried to cover the under-coverage amounts relating to household sector gross value added.

The main sources included the 2006 HIES results, 2000 and 2005 Population Census data, revised GFS data, and revised BOP statistics. The most significant changes to the estimates were for the Agriculture and forestry industry, Fishing industry, and Owner-occupied dwellings (OOD). This was due almost entirely to the incorporation of the 2006 HIES expenditure and income estimates relating to subsistence agriculture and fishing (i.e. production for own consumption), production for domestic sales, and a much higher HIES imputed rents value for OOD.

## Kuwait

### Source

Response to the United Nations national accounts questionnaire from the Central Office of Statistics, Ministry of Planning, Kuwait City. Official estimates are published by the same Office in "National Accounts Statistics".

### General

The estimates shown in the following tables have been prepared in accordance with the United Nations System of National Accounts 1993 (1993 SNA) so far as the existing data would permit.

Estimates refer to calendar year. For the purpose of deriving estimates on a calendar year basis, government accounts were readjusted from fiscal to calendar year using closed accounts for fiscal years and periodic (monthly) statements of actual expenditure. For establishments in the petroleum sector which follow the fiscal year for their accounting, estimates were made for calendar year on the basis of data available for production, sales, exports, salaries and wages, materials purchased, capital formation etc. Basic data for most of the other enterprises and foreign trade statistics were available for calendar years.

Imputed bank and insurance service charges have been derived on the basis of actual data made available by the survey that carried out and special questionnaires that sent to these banks and insurance companies.

### Methodology:

#### Overview of GDP Compilation

Basic data for the compilation of national accounts were drawn from the following sources: a) Annual Survey of Establishments, conducted by the Central Statistical Office (CSO) for the years 1995 to 2002; b) Annual Survey of Holdings, 1994-95 to 2001-2002; c) Closed Accounts of the Government, Ministry of Finance, 1994-95 to 2002-2003; d) Periodic (monthly) Statements to Actual Expenditure, 1994-95 to 2002-2003; e) Annual Foreign Trade Statistics, 1995 to 2002; f) Balance of Payments Estimates, Central Bank of Kuwait, 2000 to 2004; g) Annual Reports of the Central Bank of Kuwait, 1995 to 2002; h) Survey Results Income, expenditure and consumption, 1999-2000; i) Annual Statistical Abstract, CSO, 1995 to 2002; j) Consumer Price Index Numbers, Revised Series, (1995=100) 1995-2002; k) Wholesale Price Index Numbers, Revised Series, (1995=100) 1995-2002; l) Annual Reports of Ministries/Departments of the Government, 1995 to 2002; m) Annual Reports of various share-holding companies, 1995 to 2002. Estimates of GDP at constant prices are available by kind of activity and by type of expenditure.

The constant price estimates have been derived from current price series by deflation or by extrapolation on the basis of physical indicators.

#### Expenditure Approach

Government final consumption expenditure 'Government' excludes the industrial activities such as generation and distribution of electricity, production and supply of water, communications, ports and crude petroleum production, marketing etc., which are undertaken directly by the various departments/ministries of the government, government enterprises and public corporations. Government final consumption expenditure is obtained as the sum of compensation of employees, intermediate consumption of goods and services and consumption of fixed capital less sales of 'other goods and services'.

Private final consumption expenditure estimates presented here are obtained as residuals from total GDP after allowing for all other components.

Exports of goods and services include in addition to exports as recorded in foreign trade statistics, various services rendered by resident producers to agencies outside in the form of freight, insurance, travel, transportation

etc. It also includes purchases in the country by extra-territorial organisations such as embassies and non-resident persons. Imports of goods and services include in addition to the value of goods imported or recorded in the foreign trade statistics, travel, transportation and direct purchases abroad by government and residents of the country. The relevant estimates for the services components for exports and imports are taken from balance of payments statistics compiled by the Central Bank of Kuwait with a downward adjustment for the item – government services (debit). This item which refers to the payment of consultancy services, expenditure of Kuwaiti embassies abroad etc. was to be overestimated in the Balance of Payments statistics. The figures of imports of goods and services presented in this publication are therefore lower than those in the previous issues of this publication.

Regarding GDP by type of expenditure at current prices, estimates concerning government final consumption expenditure, exports and imports of goods and services are obtained from firm data and hence are more reliable than other components. For gross fixed capital formation, the portion concerning government services and government enterprises can be considered accurate as they are based on closed accounts but for private gross fixed capital formation assumptions had to be made. Estimates for changes in stocks are based on the results of the years 1995 to 2002. Gross capital formation has been obtained as a residual and is bound to be affected by the lack of reliability in the estimates of other components.

## **Production Approach**

GDP at producers' values is obtained as the difference between gross output valued at producers prices (that is, at prices prevailing at the units) and value of goods and services consumed in the process of production at purchasers' prices (that is, at prices paid by the purchaser).

Estimates of GDP at current prices reflect changes in quantities as well as prices of outputs and inputs. In studies on economic growth, interest mainly centers around the changes that take place in the volume of goods and services produced, that is, in real product measures. In constant price estimates, price effects are isolated so that the figures represent only changes in the physical volume of goods and services produced. The constant price estimates have been derived from current price series by deflation or by extrapolation on the basis of physical indicators.

Estimates of GDP originating from activities such as electricity and gas, water, communications, public administration and defence, governmental education, health, social, community, recreational and cultural services are based on data from the closed account of government besides of changing the methodology of estimating of GDP of electricity and water depending on the actual cost of production not on the revenue as in the previous method. With respect to data of real estate depends on services publication also the results of the survey of income, expenditure and consumption of households that carried out 1999-2000.

Timeseries data on GDP at constant prices show the changes in value added due to change in volume of production. Public sector include producers of government services and producing units completely owned by the government such as electricity generation and distribution, water production and distribution (except water tankers), communication (post, telephone and telegraph), port public authority, Shuaiba Board, Civil Aviation Department, Kuwait Petroleum Corporation, and its subsidiaries, Kuwait Airways etc.

Indirect taxes are defined as taxes chargeable to the cost of production sale of goods and services. The include (a) import and export duties, (b) excise, sales, entertainment and turnover taxes, (c) real estate and land taxes, (d) motor vehicle, driving test, license, airport and passport fees when paid by the producers and (e) the operating surplus of government fiscal monopolies on such items as tobacco. Import duties are levied on the output of foreign producers, hence they are not shown by kind of activity but as a separate item in the tables. Other indirect taxes are distributed by kind of activity.

Imputed bank and insurance service charges have been derived on the basis of actual data made available by the survey that carried out and special questionnaires that sent to these banks and insurance companies.

<sup>b</sup> Discrepancy between the Total Economy and domestic sectors since value for the Total Economy excludes FISIM.

<sup>c</sup> Includes financial intermediation services indirectly measured (FISIM).

<sup>d</sup> Includes Mixed Income, Gross.

<sup>e</sup> Discrepancy between the Total Economy and the domestic sector accounts.

<sup>f</sup> Discrepancy between components and total as one or more components have not been revised.

<sup>g</sup> Item does not consider consumption of fixed capital.

<sup>h</sup> Discrepancy with equivalent item in Table 1.3 (Relations among product, income, savings, and net lending aggregates).

## Source

The official statistics of national accounts for Kyrgyzstan are compiled and disseminated by the National Statistical Committee of the Kyrgyz Republic.

The statistical publications on national accounts are:

- National accounts for the Kyrgyz Republic, 1990-1994;
- National accounts tables for the Kyrgyz Republic, with assistance from the Statistics Directorate, OECD, 1990-1995;
- National accounts for the Kyrgyz Republic: , 1993-1997; 1998-2002; 2003-2007; 2004-2008; 2005-2009; 2006-2010, 2007-2011, 2008-2012, 2010-2013, 2010-2014, 2011-2015.
- Input-output balance of production and use of good and services of the Kyrgyz Republic ("INPUT-OUTPUT TABLE"), 2000, 2001, 2002, 2003, 2005, 2006, 2008, 2009, 2010, 2011, 2012, 2013, 2014, 2015.

Basic information on national accounts is also posted on the web site of the National Statistical Committee [www.stat.kg](http://www.stat.kg).

## General

The system of national accounts used in the Kyrgyz Republic is based on the methodological principles of the international standard System of National Accounts (SNA), adopted in 1993 by the Commission of the European Communities, the United Nations, the International Monetary Fund, the World Bank and the Organisation for Economic Co-operation and Development (1993 SNA).

According to this standard, the basic method for recording economic transactions is the "accrual method", which is also used for the SNA of Kyrgyzstan. The national accounts have been prepared using this standard since 1990.

The national accounts are compiled using data from government statistical observations, administrative bodies, banking and financial statistics and balance-of-payments statistics.

The methodology for the compilation of national accounts is described (in Russian) on the official website of the National Statistical Committee of the Kyrgyz Republic and includes:

- Methodology for calculating gross domestic product (GDP) using the production method;
- Methodology for calculating gross domestic product (GDP) on an income basis;
- Methodology for calculating gross domestic product (GDP) using the end use method;
- Methodology for compiling the primary income distribution account;
- Methodology for compiling the secondary income distribution account;
- Methodology for compiling summary indicators for the system of national accounts;
- Method for determining holding gains and changes in inventories;
- Method for determining individual indicators of national wealth;
- Methodology for measuring the non-observed economy;
- Methodology and method for calculating the gross regional product (GRP) in current and comparable prices;
- Method for compiling input-output tables;
- Method for compiling quarterly national accounts.

Methodological notes and the method of calculation of gross domestic product are available in the annual publication " National Accounts of the Kyrgyz Republic".

National Statistical Committee of Kyrgyz Republic compiles national accounts by institutional sector of internal and external economy annually in December following the reporting year. Quarterly GDP is calculated by production method (estimates on 8-10th day after the reporting quarter) and income method (on 90th day after the reporting period). Monthly GDP is estimated by production method.

The revision of quarterly and monthly estimates of GDP is provided (in December following the reporting year) after the completion of the annual revised calculations of gross domestic product by the production approach and expenditure approach (in October-November following the reporting year).

The National classification of the Kyrgyz Republic on "Economic activity" (GKED version 3) which is based on classification of the European Community (NACE Rev. 2) has been implemented for the period 2010-2015.

The financial year is equal to the calendar year.

Data on national accounts aggregates (for GDP) are presented at constant prices in the form of:

- Chain volume indices, deflators and cost indicators at the previous year prices (since 1991; production and expenditure methods);
- Volume indices, deflators and cost indicators at constant prices of 2000 and 2010 (production method).

## **Methodology:**

### **Overview of GDP Compilation**

In the Kyrgyz Republic, three methods are used to calculate GDP:

- 1) The production method;
- 2) The income (distributive) method;
- 3) The final use method (expenditure).

The primary GDP compilation method is via the production method.

### **Expenditure Approach**

Final consumption expenditure of households includes the cost of goods and services at their own expense, goods and services received as income in kind, production for own consumption. Their calculation is based on data on the volume of retail trade and market services informed in population surveys of living standards of households. The main sources of data include statistics on trade and services, balance sheet data of agricultural products, data from sample surveys on the structure of household expenditures, according to the international classification COICOP.

Final consumption expenditure by general government sector is funded from the state budget, pension fund and social insurance funds. The estimates are based on data from the report on use of State Budget and the report of the pension fund and the social security funds in accordance with Classification of the Functions of Government (COFOG).

Individual consumption expenditure by the general government sector includes current expenditure by central and local general government connected to the granting of benefits to the public for the purchase of commodities (medicines and medical supplies, transportation, sanatorium services, etc.) as well as budgetary institutions engaged in non-market production of goods and services of a personal nature.

Collective consumption expenditure by the general government sector includes current expenditure by general government on the production of non-market goods and services supplied to society as a whole.

Final consumption expenditure by non-profit institutions serving households (NPISHs) include the costs of public organizations related to the production of individual non-market goods and services, as well as providing market products to households free of charge or at discounted prices. The main sources of financing of current expenditure are member contributions, donations and other transfers.

Calculations are based on statistical information in accordance with the International Classification of the Purposes

of Non-Profit Institutions Serving Households.

Gross fixed capital formation is a growth of non-financial assets, which has been used in the production process for a long time. It includes investments in fixed capital and the cost on capital repair, equipment, durable goods, used by budgetary organisations at the expense of budget resources, the cost of geological exploration, increase in the livestock of main herds and so on. The increase in the value of the main livestock herds is determined by the balance of fixed assets at residual value (less depreciation) as the difference between inflow and outflow.

Changes in inventories are defined as the difference between the value of inventories at the end and the beginning of the year and are estimated in average annual prices of the current year, excluding holding gains. Inventories include stocks of raw materials, finished goods, goods for resale and unfinished production. The main sources of information are financial indicators from business statistics.

The value of exports and imports of goods and services is determined on the basis of statistics of foreign trade and balance of payments of the Kyrgyz Republic.

### **Income Approach**

Compensation of employees include all types of remuneration for labour, including various premiums, enhanced payments and special allowances in cash or in kind. They include contributions to social insurance funds, income tax and other statutory deductions. When wages are paid in kind, goods and services provided to employees are valued at market prices. Wages are calculated using statistical and administrative data and take into account non-observed economic activity.

Actual social security contributions include payments made by employers to a pension fund or a medical and social insurance fund and are measured by additions to the payroll for all types of social insurance. They are calculated by using cross-sectional surveys of enterprises, information on use of the State Budget and the accounts of the relevant social insurance funds.

Imputed employer's contributions to social security are paid by employers directly to employees, former employees or their entitled dependants out of their own resources without involving a third party.

Other taxes on production include payments by enterprises and organizations to budgetary and extrabudgetary funds connected with the use of factors of production, as well as payments for licences and permits to engage in any production activity and other compulsory payments required for the activity of resident production units.

Other subsidies on production are given to enterprises by general government because of their production activity. Other taxes and subsidies on production are calculated on the basis of cross-sectoral surveys of enterprises and information on use of the State budget of the Kyrgyz Republic.

Gross operating surplus and mixed income are a balancing item.

### **Production Approach**

Output is the total cost of goods and services produced by the resident unit in the economy in the reporting period. It includes non-observed economic activity.

Market output is estimated on the basis of direct data on production output (work, services) or incomings from sales. Non-market output of products for own final use is estimated on the basis of market prices for comparable goods and services or of current expenditure on their production.

Output is calculated on the base of cross-sectional surveys of enterprises, industry statistics, reports on use of the State budget and administrative information.

Intermediate consumption consists of the value of goods and services which are transformed or used up by the

production process during the reporting period. It does not include consumption of fixed capital. It does include as a separate item consumption of financial intermediation services indirectly measured (FISIM).

Gross value added is calculated in basic prices. Gross value added is adjusted for the value of the services of financial intermediaries not allocated among users of such services.

Taxes on products are charged in proportion to the quantity or value of goods and services produced, sold or imported by residents.

Subsidies on products are current uncompensated payments from the State budget to enterprises on condition of production of particular goods and services.

Taxes and subsidies on products are calculated based on the data on use of the State Budget.

Calculations of output, intermediate consumption and gross value added are produced by type of economic activity in accordance with the National classification of the Kyrgyz Republic on "Economic Activity" (GKED Ver. 2, based on NACE Rev. 1) for the period of 2000 to 2012, and GKED ver. 3 (NACE Rev. 2) is used for the period from 2010 to 2016.

Calculations are also made by institutional sector of the economy.

## **Overview of the Compilation of the Integrated Economic Accounts**

The system of national accounts (SNA) of the Kyrgyz Republic currently includes the following accounts: goods and services; production; income formation; distribution of primary income; distribution of secondary income; redistribution of income in kind; use of disposable income; use of adjusted disposable income; capital transactions.

The accounts are compiled by institutional sector of the economy, in accordance with the Classification of Institutional Sectors of the Economy of the Kyrgyz Republic (CISE), which reflects the specificities of the legislation and economy of the Kyrgyz Republic.

In Kyrgyz Republic, calculations are realizing by sectors:

- Non-financial corporations;
- Financial corporations;
- General government;
- Households;
- NPISHs.

In order to reflect transactions with non-resident units, "Rest of the world" accounts are compiled, which include all institutional non-resident units involved in economic relations with resident units. The "Rest of the world" accounts are based on balance-of-payments data compiled by the National Bank of the Kyrgyz Republic.

Linking indicators of accounts each of the institutional sectors between them is performed in an integrated table, reflecting the main cross-sectorial flows in the economy.
