**Statement provided by:**
Mexico-INEGI

**Statement:**

Mexico approves the guidance, since it presents in a comprehensive and complete manner the elements that the NOSs must consider when developing an open by default model.

Mexico considers it is very important for the directive group to have a tool that gives them a framework for implementing interoperability in the data management cycle that at the end will help in the use and reuse of the data produced by the NSOs. The inclusion of the organisational and human dimensions are very important because of their high relevance on the success of these type of initiatives.

Since open data issues are an integral part of data management policies and practices, Mexico considers that the proposal of incorporating these issues in the discussions of the Data Stewardship Working Group is the right decision.

Considering that at the present time there are no new developments on open data practices and the incorporation of open data issues in the discussions of the Data Stewardship Working Group, Mexico agrees with the proposal to dissolve the Working Group on Open Data.
