# Data and Statistics in perspective

For statisticians often  $\text{Data} = \text{Statistics}$  but the data universe is much bigger than statistics

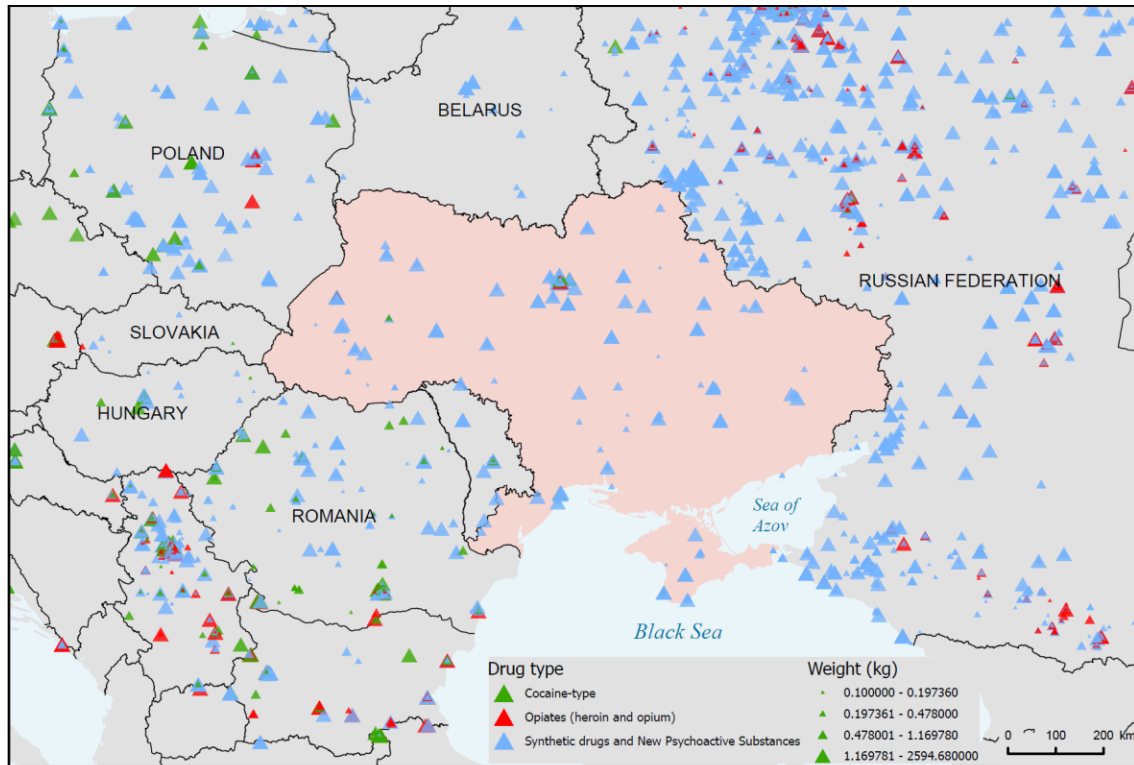

# Data and Statistics in perspective

- Data strategies and data governance frameworks relate to the larger universe of data
- Statisticians often speak about data strategies and governance frameworks in relation to the data needed for the production of statistics

# Data and Statistics in perspective: examples

## Drug Monitoring Platform: A Data system for non-statistical purposes

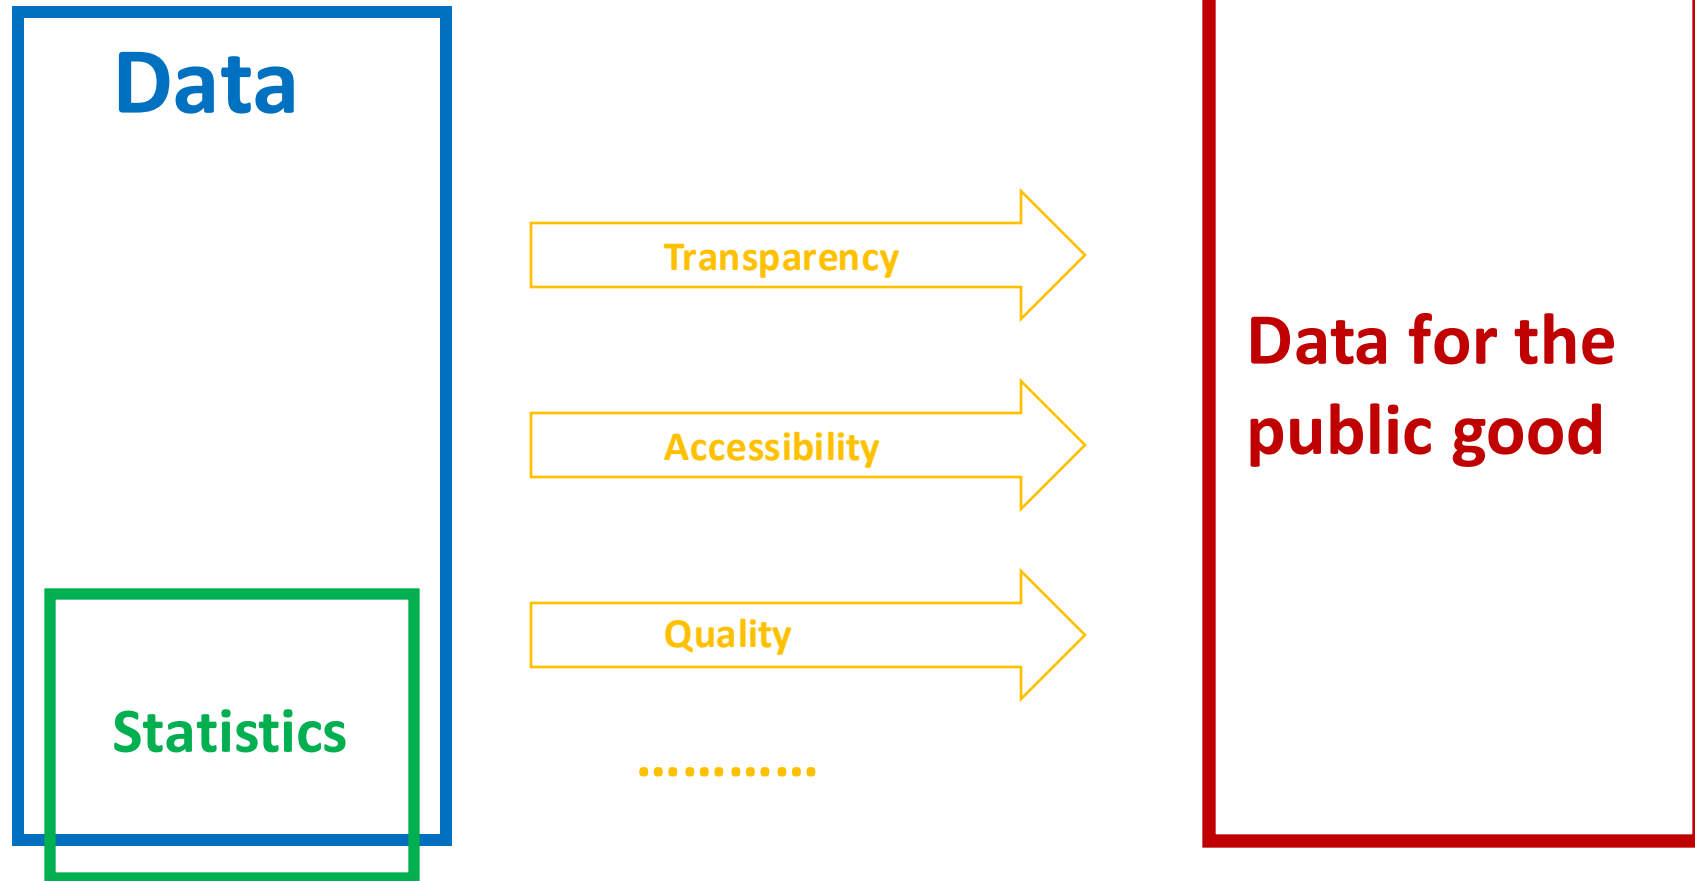

The boundaries and names shown and the designations used on this map do not imply official endorsement or acceptance by the United Nations.

## OUR VISION

Building a whole-of-UN ecosystem that unlocks our full data potential: For better decisions and stronger support to people and planet – in the moments that matter most.

## FOSTERING ENABLERS

While better abilities will in part emerge through “learning by doing”, we will foster stronger enablers to accelerate progress:

### PEOPLE AND CULTURE

Build data skills and talents, and spread a culture of collaboration, excellence, openness and sharing

### TECHNOLOGY ENVIRONMENT

Empower all users with tool sets and processes in optimal ways, so data can turn into insight and action

## NURTURING CAPABILITIES

As we tackle priorities and generate more value from data, we will build new capabilities, in an iterative and agile fashion:

### ANALYTICS

Using data to better understand “what happened”, “why it happened”, “what may happen next”, “how to respond”

### DATA MANAGEMENT

Ensuring everyone, everywhere can discover, access, integrate and share the data they need

### PARTNERSHIPS

Connect sustainably to ecosystems outside the UN family, so we can jointly unlock more value at scale

### DATA GOVERNANCE AND STRATEGY OVERSIGHT

Build governance mechanisms and strategy oversight to manage data as a shared strategic asset

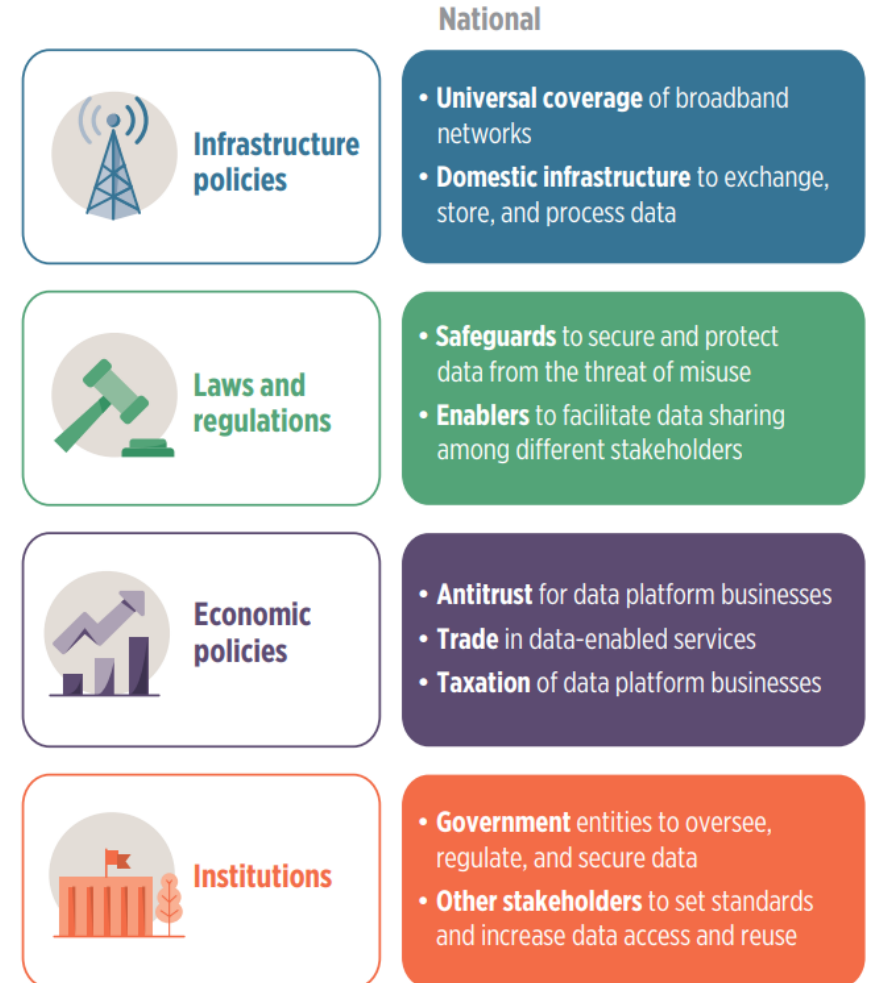

# Governing data to maximize their benefits and minimizing misuse

Data are the lifeblood of development, peace and security and human rights.

Need for Rules and Standards to manage issues such as:

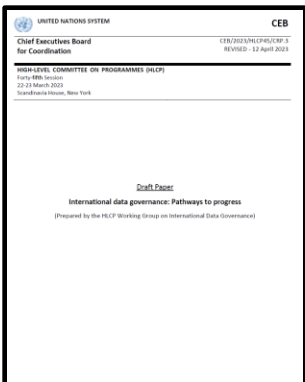

- Access
- Processing
- Use
- Re-use
- Privacy
- Interoperability
- Distribution of benefits

NSOs have dealt with these issues for a long time, how to govern data systems that have been created and/or are used for non-statistical purposes?

# International Data Governance: Why?

- Data governance have evolved in a fragmented and uncoordinated manner resulting in different approaches to governing data, with some regions focusing on protecting individual data, others on maximizing profit from data or using data to control societies in the name of national security
- Diverse and fragmented regulatory frameworks hamper data flows and data use (example, data are not shared across law enforcement agencies for fear of misuse, less crime is prevented)
- Fragmentation has produced asymmetric concentrations of data and capacities to use data, together with uneven levels of data protection and accessibility
- Many data used for public good are owned by the private sector
- Advances in data-driven technologies, such as artificial intelligence, have increased unregulated data use globally

The cost of ungoverned data and data flows: loss of trade, innovation, economic and human potential; greater inequalities, undermining of human rights, leaving peoples and communities misinformed, divided, destabilized and vulnerable

# Building interest around International Data Governance

## 2023 Digital 1.8

The need for a global consensus on data as a catalyst for development

A global consensus on data is needed to ensure that data is used to achieve the Sustainable Development Goals (SDGs) and to build a more inclusive and resilient world.

The World Economic Forum (WEF) has published a report titled 'The Digital 1.8' which highlights the importance of data in driving economic growth and development. The report states that data is becoming a critical asset for businesses and governments alike, and that a global consensus on data governance is needed to ensure that data is used in a responsible and effective manner.

The report also identifies several key challenges that need to be addressed in order to achieve a global consensus on data governance. These include the need for a common framework for data governance, the need for a global data marketplace, and the need for a global data governance framework.

The WEF report calls for a global data convention to be established, which would bring together governments, businesses, and civil society to discuss and agree on a common framework for data governance. The convention would also serve as a platform for sharing best practices and for promoting the use of data in a responsible and effective manner.

The WEF report is a timely and important contribution to the global data governance debate. It highlights the need for a global consensus on data governance and provides a clear roadmap for achieving this goal. The report is a must-read for anyone interested in data governance and its role in driving economic growth and development.

A call for a Global Data Convention  
<https://worldstatisticsday.org/2020/blog/Global-Data-Convention.html>

We urgently need a Global Data Convention. Here's why -

# Vision

*With a view to promoting and protecting data, the aim is to define a multistakeholder approach to international data governance, which responsibly unlocks the full value of data for all, while ensuring accountability and agility*

# Goals

## Value

- Across all domains (sustainable and inclusive development, peace and security, human rights, and humanitarian assistance)
- increased responsible data use and reuse
- Fostering culture
- Harmonizing taxonomies

## Trust

- secure environments
- adopting a human rights-based approach
- responsible data practices (transparency, accountability, data quality, integrity, and the security)

## Equity

- equitable distribution of data benefits
- representation of all people and communities
- preventing bias and discrimination
- balance between individual and collective needs
-

# Value

## Enabling Environment for Data Use and Reuse

- Culture that values and promote (open data)
- Education and empowerment of individuals, communities, and organizations to produce or co-create

## Interoperability

- adopting standardized and open formats, protocols, taxonomies, and interfaces
- improved consistency and integration across different systems

**Example:** national weather data systems that follow the same standards can predict weather

## Mutuality and Solidarity

- prioritize mutual benefit and solidarity so that data can be used for the greater good of society

# Trust

## Human Rights-Based approach to data

- All human right for all and promoting and protect data-specific rights

## Accountability

- clear roles and responsibilities over data assets and processes

## Data Quality

- ensuring that accurate, reliable, timely data and meta-data are available
- maintain data integrity and prevent data corruption, manipulation, or distortion

## Data Security and Infrastructure Protection

- Safeguard data infrastructures
- organizational and technical safeguards, procedures and systems to prevent, mitigate, report and respond to security breaches of data

# Equity

## Digital Self-Determination

- Recognize the principle of digital self-determination
- empowering individuals and communities to have control over their data and its uses
- giving them the right to access, correct, delete, and agree to the purposes of data processing

**Example:** co-owned thematic data communities

## Fairness and Non-Discrimination

- Reduce and correct for bias and discrimination throughout the data lifecycle
- fair distribution of the data benefits

## People-centred

- people at the centre of data governance decision-making

## Encourage Data Stewardship

- Encourage and resource responsible data stewardship properly manage, curate and protect data and to maximize data (re)use for the public good

# Global Digital Compact: agreement among countries

## Objective 4. Advancing responsible, equitable and interoperable data governance approaches

### We commit by 2030 to:

Draw on existing international and regional guidelines on the protection of privacy in the development of data governance frameworks

Strengthen support to all countries to develop effective and interoperable national data governance frameworks

Empower individuals and groups with the ability to consider, give and withdraw their **consent to the use of their data** and the ability to choose how that data is used, including through legally mandated protections for data privacy and intellectual property

Ensure that data collection, access, sharing, transfer, storage and processing practices are **safe**, secure and proportionate for necessary, explicit and legitimate purposes, in compliance with international law

Develop **skilled workforces** capable of collecting, processing, analyzing, storing and transferring data safely in ways that protect privacy

Develop data and metadata standards designed to prevent and **address bias**, discrimination or human rights violations and abuses throughout the data life cycle, including through regular data auditing

Develop basic definitions and data classifications to promote **interoperability and facilitate data exchanges**

Develop common definitions and standards on the use and reuse of data for public *benefit*

Increase **financing for data and statistics**, including through mobilization of domestic resources, and enhance efforts to build capacity in data and related skills, as well as responsible data use, particularly in developing countries. We will aim for a 50 percent increase in financing for sustainable development data

Strengthen efforts to collect, analyze and disseminate relevant, accurate, reliable and disaggregated data for better monitoring and policymaking to accelerate the achievement of the 2030 Agenda, while respecting privacy and data protection. We will aim for a 50 percent increase in the data available to monitor the Sustainable Development Goals, disaggregated by income, sex, age, race, ethnicity, migration status, disability and geographic location and other characteristics relevant in national contexts

Develop open and accessible data systems to support effective disaster early-warning, early action and crisis response

Advance consultations among all relevant stakeholders to better understand commonalities, complementarities, convergence and divergence between regulatory approaches on how **to facilitate cross-border data flows with trust** so as to develop publicly available knowledge and best practices

# Challenges and opportunities for NSOs

From a production factory towards.....A clearing house?
