
Agenda item No. 17: Calculation of Trade Indicators
Presentation
Language: Spanish

SISTEMA INTEGRADO DE COMERCIO EXTERIOR

Presentation by

Andean Community (CAN)
Agenda item 19 (a):
Globalization and the OECD Trade Indicators Project TIP

Introductory remarks:
Globalization…

- means (amongst other things) that almost everything becomes more interconnected and, hence, more difficult to analyse and to measure
- puts statistical measurement frameworks at considerable stress (they measure sometimes the wrong things and refer to “national” concepts which need to be linked to international processes)
- means that trade is one, but just one, of its visible expressions
- We have difficulties to statistically correctly allocate the components of the new paradigm of economic processes
OECD took on board a great challenge:

- OECD is the recognized analytical hub of international globalization analysis and “sherpa” of G8 summits
- The new Secretary General, Angel Gurría, has put globalization as top priority on OECD’s agenda
- OECD’s 30 member countries’ membership will expand rapidly to facilitate global analysis
- Candidates (there are over 20!) include:
  - Latin American countries
  - EU countries not OECD members so far
  - Perhaps Russia, Israel, South Africa, and other BRICS

Coming to Trade Statistics and the TIP now:

- Excellent news: OECD’s Trade Statistics will be raised to the rank of “Working Party” activity in June 2007 – at par with National Accounts and Short-Term Economic Statistics – this is a very important event in OECD’s “pecking order”
- This is in recognition of and following recommendations made of a number of factors which have been identified during the Trade Statistics Quality Reviews of OECD
The OECD Trade Indicators

- Genesis: we have a wealth of trade data – why not making consistent and analytically pertinent use of it for the benefit of governments, academia, civil society?
- Roundtable Expert Group, composed of OECD analysts and statisticians and external experts, set up framework and measurement standards
- Incremental implementation (which continues)
- One of the most popular OECD datasets accessed by external users
- Extremely positive feedback

The quality framework: TIP data has to be...

- Relevant
- Accurate
- Credible
- Timely
- Accessible
- Interpretable
- Coherent
Recent achievements

- Methodological framework for the current indicators finalised
- Multidimensional OECD Trade Indicators database(s) installed in OECD Warehouse:
  - *Macro* Trade Indicators (aggregated level)
  - *Micro* Trade Indicators (detailed level)
- General public access via OECD.STAT

Recent achievements (cont’d)

- The Macro Trade Indicators are available both *at current and constant prices*, the Micro Trade Indicators *at current prices only*

- Several key macro indicators have been included in the 'Economic Globalisation' chapter of the OECD Factbook 2006, and several indicators were included in the 'Aspects of trade globalisation' chapter of the OECD Economic Globalisation Indicators (*EGI*) publication
How does this look like at present?

- Micro Trade Indicators: 14 data cubes and more in 2007 (ICT etc.)

### Table 1: Macro Trade Indicators

<table>
<thead>
<tr>
<th>Indicator</th>
<th>Description</th>

TIP Pivot charts online

- Customisable pivot charts for the Macro Trade Indicators have been provided for download and individual country profile charts (based on the macro trade indicators)
- These can be downloaded from the publicly available International Trade and Balance of Payments Statistics website.

But caution: Even simple indicators may give rise to different measurement!

- Trade-to-GDP-ratio
  - Definition: The most frequently used indicator of the importance of international transactions relative to domestic transactions is the trade-to-GDP ratio, which is the sum of exports and imports of goods divided by GDP. International trade tends to be more important for countries that are small (in terms of size or population) and surrounded by neighbouring countries with open trade regimes than for large, relatively self-sufficient countries or those that are geographically isolated and thus penalised by high transport costs. Other factors also play a role and help explain differences in trade-to-GDP ratios across countries, such as history, culture, (trade) policy, the structure of the economy (especially the weight of non-tradable services in GDP), re-exports and the presence of multinational firms (intra-firm trade).
  - TIP is consistent in its measurement with IMF, WTO and general practice in countries
  - However, OECD’s Economic Globalisation Indicators advocate the average of both imports and exports
**Trade-to-GDP in TIP OECD.Stat**

![Trade-to-GDP in TIP OECD.Stat](image)

**Trade to GDP ratios**: Difference between 2005 and 1992 ratios in percentage points

![Trade to GDP ratios](image)
Another example: also country rankings can be misleading

- Generally useful and conveys clear message
- But caution before drawing quick conclusions
- For instance, the following 3 slides show
  - Germany is net **goods** exports champion
  - The United States are net **services** exports champion
  - A new concept, the “normalized trade balance” used in TIP, helps to illustrate unbiased trade performance across time, countries and sectors. The removal of a country’s weight allows a better appreciation of smaller countries’ trade performances.

---

**Merchandise Trade Balance**

Billions US dollars, 2004

USA= - 707 billion (in red)

Germany= + 193 billion (in green)
Services Trade Balance
Billions US dollars, average 2001-2004
USA= + 57 billion (in red)
Germany= - 50 billion (in green)

OECD TIP: The normalized merchandise trade balance: a country’s international transactions with the rest of the world are normalized on its own total trade. \((NT=X-M/X+M)\) is a more pertinent measure of trade performance.
Perception and reality: Export champion Germany: some globalisation facts
Years 1991 and 2004 (Source BDI)

- Share of industry in economic value added declined from 25% to 21%
- Vertical integration declined from 39% to 34%
- Foreign share of intermediate inputs increased from 20% to 26%
- Import content of exports increased from 26% to 42%

Germany in international competition

German economic trends

- Germany’s industrial production base is declining
- “Made in Germany” is no longer originally produced in Germany
- Transformation from a production site into a commercial hub
Germany in international competition

- Internationalization strategies
  - Cost reduction / rationalization
  - Relocation
  - Reorganization of the value chain
  - Complementary production

Bazaar economy: Statistical evidence and indications

- industrial share in the economic value added:
  1991: 25 % \(\downarrow\) 2004: 21 %
- vertical integration
  1991: 39 % \(\downarrow\) 2004: 34 %
- foreign share of intermediate inputs
  1995: 20 % \(\uparrow\) 2000: 26 %
- import share of exports
  1991: 26 % \(\uparrow\) 2005: 42 %
  - engineering: 30.9 %
  - chemical industry: 51.7 %
  - automotive industry: 37.0 %
Growth patterns 2004/1988 Partner countries and regions of OECD merchandise imports – non-OECD is the more dynamic region

As a percentage of total OECD merchandise imports

So, both global structure and composition of trade flows are changing

- Dynamic economies modify global trade pattern
- New players emerge and solidify their market penetration (e.g. China)
- The role played by Information and Communication Technologies (ICT) considerably increased in recent years in merchandise trade
- The increasing import content of exports also mirrors globalisation
- Some hard facts:
Current definition for the ICT sector by OECD:

ICT goods broad categories
based on six-digit HS categories

- telecommunications equipment
- computer and related equipment
- electronic components
- audio and video equipment
- other ICT goods

Some key facts and figures:

Composition of OECD ICT goods trade

USD millions, current prices
Direction of OECD ICT goods trade

- Exports to OECD
- Exports to Non-OECD
- Imports from OECD
- Imports from Non-OECD

The main exporters of ICT goods: recent trends in billion US $

China is now the biggest ICT Goods Exporter

A revolutionary concept: StatLink

What is it?
OECD’s StatLink is an electronic publishing solution that enables links between publications, whether they are in print or e-book format, and the underlying data in MS Excel spreadsheets. StatLink uses the Digital Object Identifier technology (DOI) which is an emerging international standard for identifying published material online.

What it means for users...
- MS Excel downloads of figures used in tables that can be tailored for users’ own needs.
- Access to the most up-to-date documents, data and graphs.
- Access to the underlying data of a table.
- Data spanning a longer time period than that available in a printed publication.
- All OECD data products are incrementally “equipped” with this great tool for researchers.

An example: the last OECD Statistical Factbook, issued last month

TIP is integral part of it
... as are all other OECD databases
1. In the Data Warehouse
2. Obeying to general and implemented standards, such as
   3. SQL
   4. SDMX
3. And the entire, standardized OECD data workflow (StatWorks, MetaStore, PubStat)
Now you ask perhaps: what is in for me? Can I access all this?

- The answer is YES
- A quick tour:
  - Simply “google” to “OECD”:
  - www.oecd.org
  - …then on “statistics”
  - …all is under “International Trade and Balance of Payments”
  - …Country profiles, macro and micro trade indicators. You can work with the data, export, dynamically rank etc.
- And more…

Thank you for your attention!
