UN-GGIM: A global geospatial initiative

Formal inter-governmental UN Committee of Experts to:

- Discuss, enhance and coordinate Global Geospatial Information Management activities by involving Member States at the highest level. Reports to ECOSOC
- Make joint decisions and set directions on the use of geospatial information within national and global policy frameworks
- Work with Governments to improve policy, institutional arrangements, and legal frameworks
- Address global issues and contribute collective knowledge as a community with shared interests and concerns
- Develop effective strategies to build geospatial capacity in developing countries

What Happens in an Internet Minute?

And Future Growth is Staggering

Data Volume & Variety Explosion Continues - Terabytes, Petabytes, Exabytes, Zettabytes

- Sensors, RFID, LIDAR, Raster, 3D, Crowdsourcing, SDIs
- Terrain Models and 3D city models for planning, maintenance, emergency response, tourism
- New data products for consumers, mobility, defense, intelligence, land and water mgmt, transportation, environment, agriculture, and constituent services
- Tagged Data , Semantics , Ontologies -- Location is a Powerful Organizing Principle
- Integrate Social Media (Video, Audio, Text, Wikis, Facebook, Twitter, Imagery) with Spatial; HADOOP Support
- 2020 = 35 Zettabytes Generated by Us

NHK Special

Disaster Big Data

Saving Lives Through Information

Aired Mar 3, 2013 on NHK General TV / NHK World Premium
Aired April 13, 2013 on NHK World TV

Population distribution map

Distribution of people in the area hit by tsunami at the time of earthquake

Traffic congestion map of the disaster area

How did people react to the Magnitude 9.0 earthquake, massive tsunami, and nuclear accident that followed on March 11, 2011?

What determined their fate and what could have been done to save more lives?

Eight companies and organizations including NHK, Google Japan, and Twitter gathered the huge amount of disaster-related data stored from that day to share for analysis. Projects have been launched by government, business, and academia to establish new tools created using Big Data.

How did people react? What did they do? A complete picture of that day cannot be revealed with video footage alone, but by using Big Data it is unveiled in the program. We examine the lives of people as they fought the disaster by investigating the traces of movements made by hundreds of thousands of people in the area, by driving records left on car navigation systems, and 180 million tweets posted in the one week following the disaster.
