Chapter 12: Bilateral asymmetries, data sharing and global groups register

United Nations Statistics Division
Seminar on Accounting for Global Value Chains
Luxembourg – June 2017
Chapter 12 describes:

Reconciliation and sharing of official GVC statistics

- Consistency of business and trade statistics across countries
- Need for data sharing
- Methodological approaches and recommendations to resolve bilateral asymmetries
- Advantages, ways forward and challenges of building a global register of enterprise groups
- Shared GVC-specific multi-partner extended SUT

**Contributors:** UNSD, Statistics Denmark, Statistics Netherlands, ISTAT, OECD and Eurostat
Chapter 12: Table of Contents

I. Purpose of Chapter 12

II. Bilateral asymmetries

A. Bilateral asymmetries in merchandise trade statistics
B. Bilateral asymmetries in trade in services statistics
C. Bilateral asymmetries in Foreign Affiliate Statistics
D. Focusing on reconciling asymmetries for specific GVCs and main partners

III. National & Bilateral Data sharing among statistical agencies

A. Micro-data sharing
   i. Exchange and sharing of economic data
   ii. International Collaboration on Microdata Access
B. Focusing on specific GVCs and main partners

IV. Global register for enterprise groups

A. Building the Global Groups Register
   i. The Euro Groups Register
   ii. The Global Groups Register
   iii. The Global Legal Entity Identifier System (GLEIS)
B. Focusing on specific GVCs and main partners
Reconciliation and sharing official GVC statistics

Especially for nationally important GVCs, you need

- Consistency of bilateral trade statistics (goods and services) with main partners
- Consistency of bilateral investment statistics (FDI and FATS) with main partners
- Coherence and consistency in enterprise group structure and related statistics with main partners
- Agreement on balancing of shared GVC-specific multi-partner extended SUTs
- Data sharing arrangements and agreements among main partners in the GVC
- Shared working environment for frequent updating and reconciling of shared data
Bilateral asymmetries in merchandise trade statistics

- Valuation: CIF (imports) – FOB (exports)
- Partner country attribution: Country of Origin ↔ Country of Consignment
- Differences in coverage (Trade system and the inclusion or exclusion of certain transactions)
- Under-valuation on exports (Goods for processing)
- Differences in goods classification
- Suppression of details due to confidentiality
- Time of recording
Value: FOB and CIF

a) Exports valued at FOB include the value of the goods plus services to deliver goods to the border of the *exporting* country

b) Imports valued at FOB include the value of the goods plus services to the border of the *exporting* country’s statistical territory

c) Imports valued at CIF include the value of the goods plus insurance services and freight services from the country of export to the country of import

How to reconcile asymmetries caused by Imports CIF versus Exports FOB?

- **Compile FOB for imports, as recommended by IMTS2010**
- Compilation ofImports FOB can be done (1) via direct reporting of insurance and freight on Customs declarations or (2) via estimation on the basis of surveys of importers or econometric (gravity) models, taking account of kind of goods (e.g. need for refrigeration), distance to partner country, and mode of transport
“Country of origin” at imports and “country of final destination” at exports are often not symmetrically recorded.

Country of origin is the country where the last “substantial transformation” of the good took place. The importing country knows the country of origin.

Country of final destination – in practice – is the next country, where goods will be cleared. The exporting country does not know with certainty where the goods will end up.

The country of final destination may coincide with the country of origin, but with a fragmented production process, this may be rather the exception than the rule.

This means that the use of “country of origin” at imports leads to bilateral asymmetries in merchandise trade statistics.
How to reconcile asymmetries caused by partner country attribution?

- **Country of consignment** means the next country where goods were (imports) or will be (exports) cleared.
- IMTS2010 recommends country of consignment for imports and exports (as additional partner country attribution).
- Country of consignment will reduce by definition the asymmetries caused by partner country attribution.
## Example

</tbody>
</table>
In SNA2008 and BPM6, **Goods sent abroad for processing** are recorded on a strict change of ownership basis (if there is no change in ownership, the goods transactions are excluded).

Instead, a trade in services transaction is recorded in BPM6 and in the related MSITS 2010.

In IMTS 2010 all transactions of goods for processing are recorded on a gross value **regardless of change of ownership**.

Using detailed MSITS and IMTS data in compiling the Supply and Use Tables will lead to double counting in the national SUT and to bilateral asymmetries in the multi-country SUTs.
Random asymmetries

- Differences in classification of goods at exports and at imports
- Differences in valuation of goods at exports and at imports
- Suppression of detail of goods transactions at imports or at exports
- Differences in the exclusion of certain types of goods transactions at imports or at exports
- Differences in time of recording of goods at exports and at imports
Bilateral asymmetries in trade in services

- The availability and quality of trade in services data are unsatisfactory, compared to IMTS.

- A variety of different data sources and estimation techniques are used that vary by country and vary by category of service.

- For many countries, complete information by EBOPS category is available for at least one or more (recent) years, but not for the entire period.

- In UN Comtrade, **52 out of 197** countries have reported bilateral Total Trade in Services data since 2000. This represents **47%** of total services worldwide since 2000, because these reporters are the larger economies.

- For these 52 countries, **80%** of the data are specified by EBOPS category. This detailed bilateral data represents **40%** of Total trade in services worldwide since 2000.
Trade in services estimations

- A ‘top-down’ approach is used:
  - Develop complete dataset of total trade in services data with partner World;
  - Develop complete dataset of all main EBOPS categories with partner World;
  - Develop complete dataset of total trade in services by partner country;
  - Develop complete dataset of all main EBOPS categories by partner country

- Missing cells are estimated using back-casting, now-casting and interpolation, starting, top-down, with the three main categories - transport, travel, and other services
To improve quality of FATS statistics:

- Mirror comparisons between two and more FATS data sets are useful for improving the quality of statistics
- Use the Euro Group Register (EGR)
- Co-operate bi-laterally with another statistical institute to provide feedback on how to improve the statistics

Major obstacle:

- Determining (and agreeing on) the residency of the ultimate controlling institutional unit (UCI)
Data sharing among statistical agencies

**Main benefits:**
- lower response burden
- lower non-response rate
- improved efficiency
- better precision

**Main challenges:**
- legal and confidentiality constraints
- dependency on external data providers
- timeliness
- differences in concepts and classifications
- quality issues of external data
- maintaining trust
- technical capacity
- willingness to exchange data

**Strategies:**
- bilateral agreements
- communication with respondents
- following best practices
- back-up systems/strategies for breaks in external data flow
- new editing and now casting methods
- co-operating with partners
- developing coordination mechanisms
- exchanging information & experience
- developing guidelines or technological tools

Global Groups Register (GGR)

UNSC (Decision 46/107 in 2015) officially requested to

1. prepare a “Handbook on the measurement of international trade and economic globalization statistics”

2. create a global register of multinational enterprise groups

**Handbook Context** = growth in globalization and resulting need for an extended set of business statistics and economic accounts

**Handbook Focus** = Measurement and analysis of regional and global value chains
Confidentiality will be the main issue

- NSIs are reluctant to share confidential micro-data

- GGR → no legal framework as EGR, but can build on:
  - the EGR platform
  - the experience in using commercial data
  - the LEI developments
  - the UN capacity to recommend better sharing of information
GGR Potential Data Sources

- **The Global Legal Entity Identifier System (GLEIS)**, mandated by the G-20 to assign a reference code that uniquely identifies legally distinct entities engaged in financial transactions.

- **Commercial Data Providers**

- **Administrative Sources**
  - **EDGAR (USA)** - submissions by companies required by law to file forms with the U.S. Securities and Exchange Commission (SEC)
  - **European Business Register**, a network of administrative business registers kept by registration authorities in most EU countries

### PROS
- Unique identification of entities
- Available free of charge
- Good coverage
- Short-term data availability
- High quality, regular and timely, validated
- Standardized
- Available online

### CONS
- Limited coverage, especially outside of the financial sector
- No unique identification of entities
- High cost
- NSIs unlikely to validate
- Use of EDGAR may require specialists/is labor intensive
Update on GLEIF

- In May 2017 GLEIF began collecting ‘Level 2’ data to answer ‘who owns whom’
- If the direct and/or ultimate parent of an LEI registrant has obtained an LEI, the child legal entity will be obliged to provide LEI of its direct and ultimate parent

Data elements of Level 2 information:

- Identify the legal entities involved
- Specify the type and other characteristics (e.g. dates) of the relationship
- Relationship validation and reporting information collected by the LEI issuing organization

TOTAL GLEIF POPULATION 510,743
TOTAL GLEIF RELATIONSHIPS 4,760
The joint Eurostat/UNSD project

1st phase

- Tests on different possible sources to prove the feasibility
- Tests on global profiling
- Reflection on the GGR content and on flows with EGR

2018: Report to the UNSC
Reconciliation and sharing official GVC statistics, especially for *nationally important GVCs*

**Meaning for the interactions with the most important economic partners in some specific GVCs**

- Consistency of bilateral investment statistics (FDI and FATS) with main partners
- Coherence and consistency in enterprise group structure and related statistics with main partners
- Agreement on balancing of shared GVC-specific multi-partner extended SUTs
- Data sharing arrangements and agreements among main partners in the GVC
- Shared working environment for frequent updating and reconciling of shared data
Thank you
