

United Nations Statistics Division

DATA PROCESSING IN UNcomtrade

Regional Workshop on IMTS – Malé, Maldives

3 April 2017

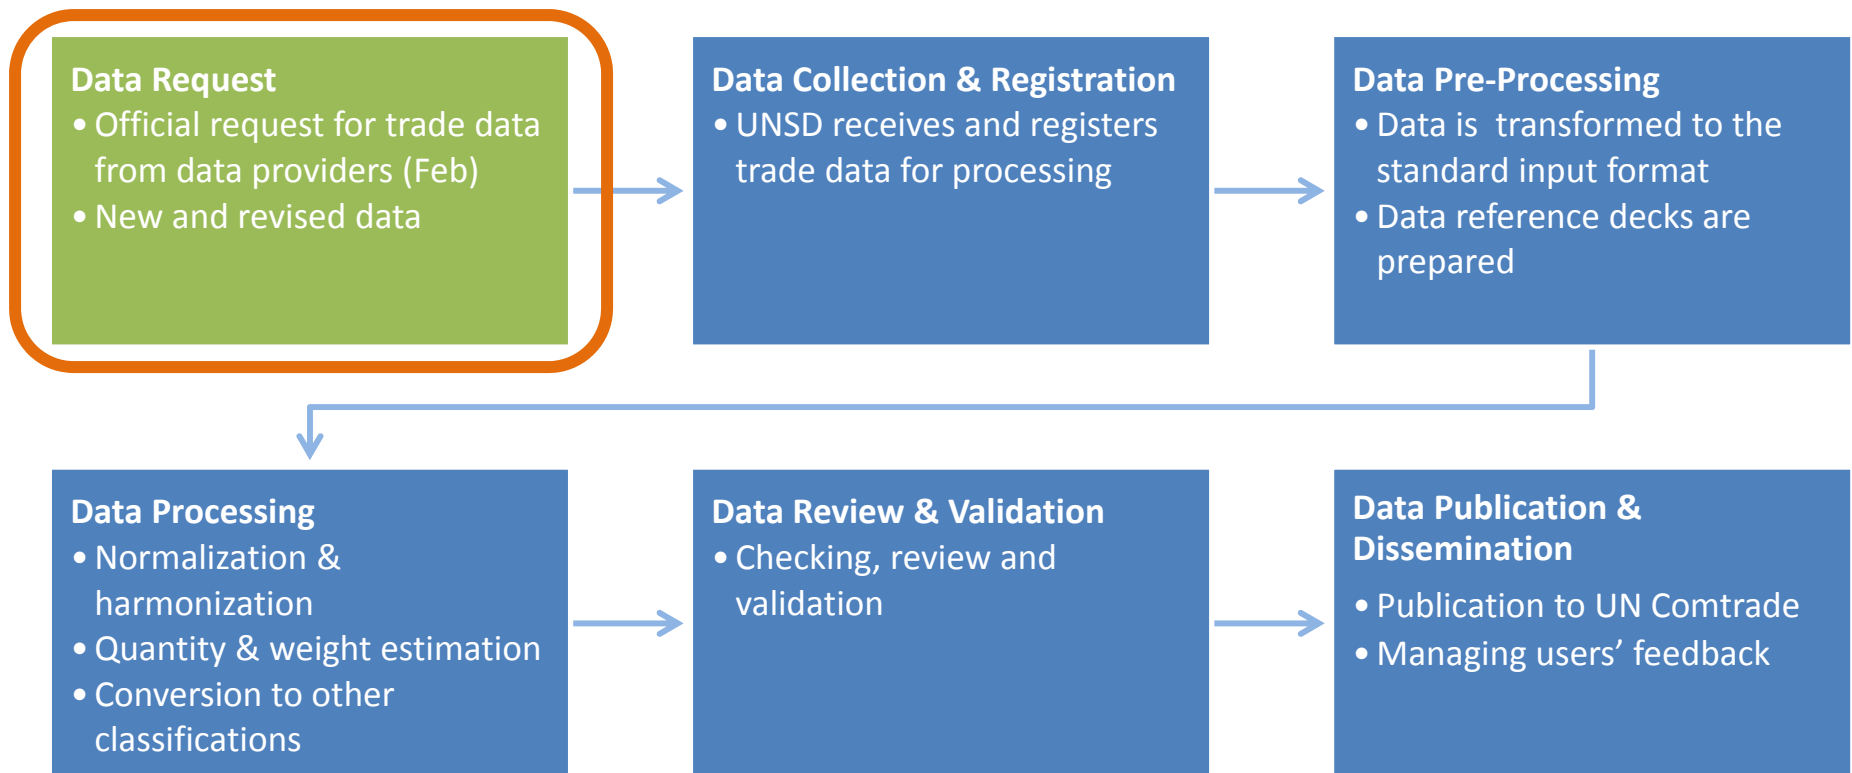

UN Comtrade Database

- United Nations International Trade Statistics Database
- Comprehensive repository of official detailed international trade data since 1962
- It contains both merchandise and services trade data
- <https://comtrade.un.org/>

Production Process: Data Request

Data Items

Pre-IMTS 2010

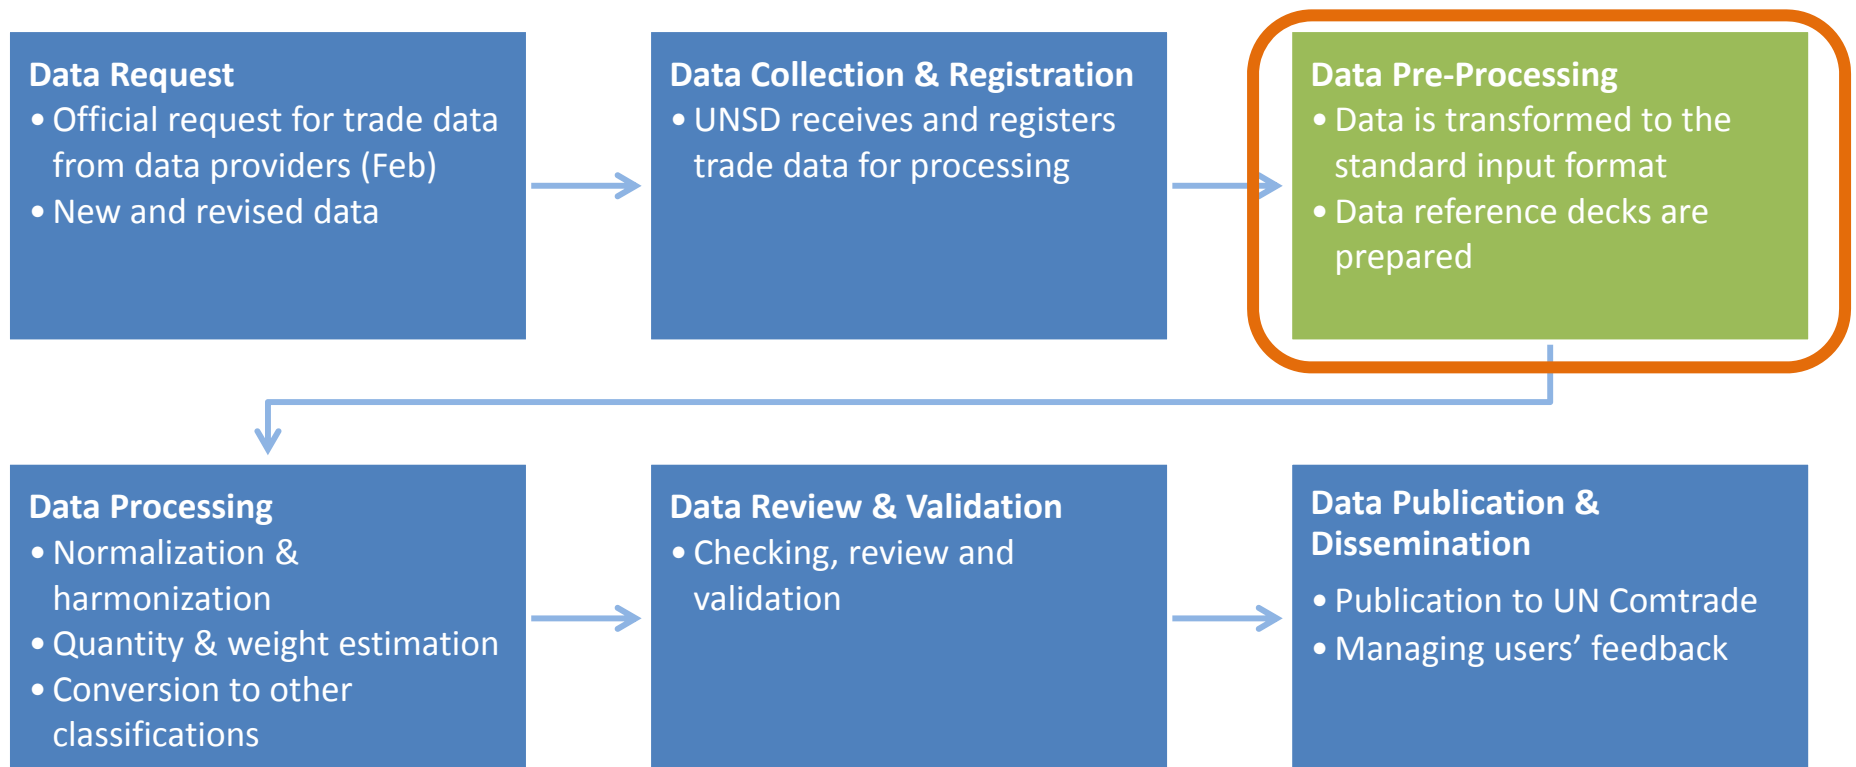

- Commodity
- Partner
- Trade values
 - CIF for Imports
 - FOB for Exports
- Net weight
- Quantity and units
- Official totals

IMTS 2010 (new items)

- Partner
 - Consignment
- Trade values
 - FOB for Imports
- Mode of transport
- Customs procedure codes

Production Process: Pre-processing

Pre-Processing Objectives

- **Transform** national data into the input format required by the internal processing system
- Maintain the original level of detail
- Ensure that national code references are available so that we are able to map national codes to standard codes correctly during processing stage
- Handle unique and special cases
- Produce an output file in .mdb or tab-delimited format

National Data

- Formats:
 - Text files (.txt, .dat, .tsv)
 - Worksheets (.xlsx)
 - Database (.mdb/.accdb, .dbf)
- Methods: Email, FTP, Direct download, CD
- Content:
 - Detailed trade data
 - Reference decks
 - Official Totals
 - Data layout
 - Explanatory notes
 - Other supplementary files

Tools and Software

- MS Access
- Excel
- Notepad ++
- SQL
- SQL Server Integrated Services (SSIS) and fATA
- R
- Etc.

Pre-Processing Procedure

Import the original data file

- Maintain and keep level of information originally submitted (do not aggregate)
- Ensure that the necessary parameters/fields are available
 - Trade flow, commodity at detailed 6-digit level, partner code, trade value, weight, quantity and quantity unit code
- Ensure that data layout is accurate

Pre-Processing

Inspect data

- Check trade values against metadata. Trade values may sometimes be broken down into value, insurance and freight.

Example: USA data – Imports at C.I.F., Exports at F.O.B.

In order to arrive at C.I.F., we need to add [General Imports Customs Value] and [General Imports Charges]

- Check if there are negative values
- Check if data has aggregated values

Pre-Processing

Inspect data (cont.)

- Accumulated/Aggregated Totals
 - Aggregate detailed data to get totals by trade flow, and compare with official or reported totals.
 - New vs Revised datasets: We compare aggregated totals in detail to determine if we should re-process revised data

Pre-Processing

Inspect data (cont.)

- Supplementary files containing detailed trade data provided

Example: Russian Federation

Main data file has record for unknown commodity and partner, with trade value.

Supplementary file provides gas and oil data with unknown partner and trade value

→ *We insert a record with the correct commodity code for gas and oil and the corresponding reported value.*

→ *In order for accumulated totals to remain as reported, we adjust the unknown commodity and partner trade value record by removing the corresponding value for gas and oil. This minimizes the value under unknown commodities, and provides the reported value for gas and oil in the dataset.*

Pre-Processing

Inspect data (cont.)

- Oil producing countries – Verify that related oil trade data is reported
 - If not available, request data from country
 - We can still process data with an explanatory note that the dataset excludes oil data

Pre-Processing

Inspect data (cont.)

- Confidential values
 - Suppressed data under pseudo headings
 - ‘9999AA’, where ‘AA’ reflects chapter (i.e. UK)
 - Data provided in commodity detail and submitted with supplementary file containing confidential commodities requested to be suppressed during processing by mapping to <chapter>+”0000” (i.e. Switzerland)
 - Reported as negative values under unknown commodity (i.e. Australia)

Pre-Processing

Handle reported high-level data

- High-level totals must be greater than the aggregated totals of detailed records
 - Check and compare the high-level vs the detailed totals
 - We use the feature of EXCEL to calculate and compare TOTALS BY PARTNER, keeping in mind that the overall totals must be the same.

Pre-Processing

Create reference decks

- Create reference decks for national data items and map these unique national codes to standard reference decks
 - Partner Codes: National Codes -> M49
 - Quantity Units: National Codes -> WCO units
 - Modes of Transport
 - Customs Procedure Codes: National Codes -> Revised Kyoto Convention Codes

Challenges in Pre-Processing

- Data format is difficult, but not impossible, to convert into standard format
 - Example: .pdf or .doc
 - Data in worksheet format instead of record format
 - Multiple and large files
- No data layout information
- Incomplete metadata/explanatory notes
 - Trade system
 - Valuation
 - Partner country attribution
 - Weight – net or gross?

Challenges in Pre-Processing

- Reference decks not provided
- Other languages
- Exports data for oil not available for oil producing countries
- High-level data; commodities not in 6-digit level; confidential data
- High percentage of invalid commodity codes resulting big memorandum items

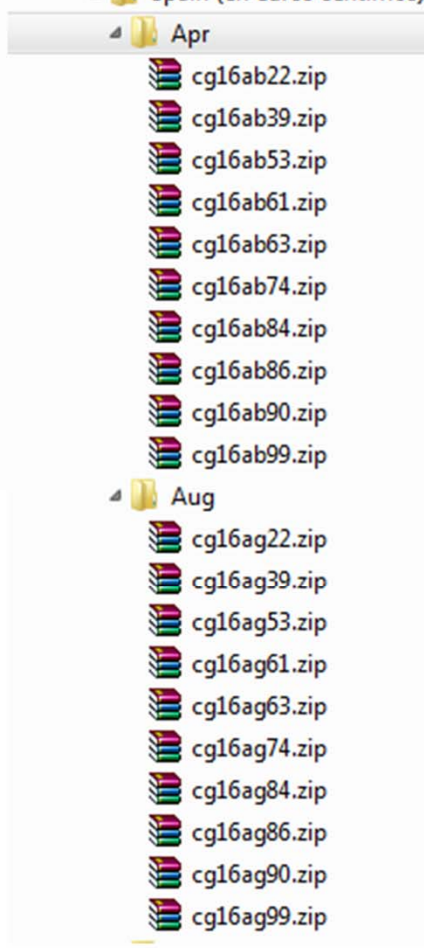

Worksheet, different language

Pre-processing tool:

SQL Server Integrated Services (SSIS)

- Advantages:
 - Can handle multiple data sources and formats in a single package
 - Great for complex transformations, multi-step operations
 - Can store the pre-processing steps in a package ensuring consistency in method
 - Able to join and loop through multiple files
- Disadvantages
 - Learning curve
 - Needs software and technical support
 - Assumes that national data format is stable; Any change in input format will require an update to package.

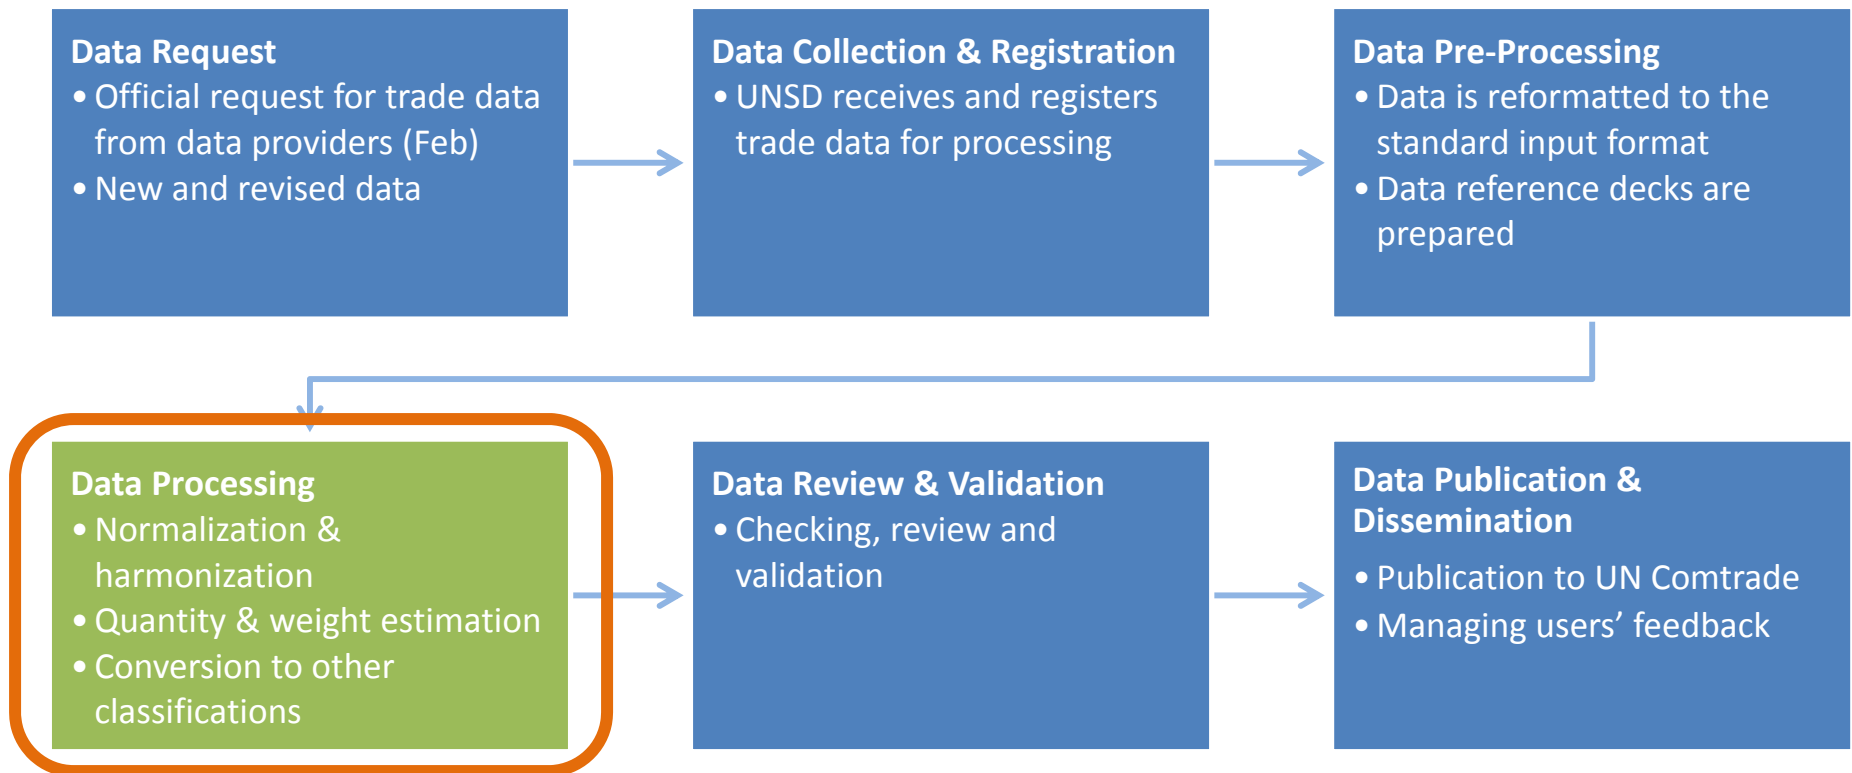

Sample SSIS package

Production Process: Processing

CoprA: Internal Processing System

"Combined Processing System"

CoprA: Pre-IMTS 2010

- Three separate processing systems for annual merchandise, monthly merchandise, annual trade in services data
- MS Access is used as an intermediate format between national data format and SQL server

CopraPlus: IMTS 2010

- Single processing system for annual and monthly merchandise, as well as annual trade in services data
- Includes IMTS 2010 data items
- Text file is used as an intermediate format

TableName	Import_export_2016	2017-03-10T18:17:13

Standardization and Harmonization

Code and Commodity Normalization

- Code Normalization
 - National data items are mapped to standard codes (M49, WCO, Revised Kyoto Convention Codes)
 - Currency conversion to USD
 - Output: Tariffline data
- Commodity Normalization
 - Removes monetary gold [HS: 711890, 710820] from dataset
 - Non-standard codes are addressed
 - Special codes are mapped (i.e. pseudo-codes)

Quantity and Weight in UN Comtrade

Objectives

- Standardize quantity and weight information according to WCO recommended units in order to provide users with comparable and comprehensive information as possible
- Estimation will be done at the most detailed reported level (tariff line data)

Estimation Methodology

- Mathematical conversion (pounds to kg)
- Estimation using FAO conversion factors for selected commodities (i.e., 1 l of heavy cream = 1.02 kg)
- Estimation using partially reported quantity and/or net weight
- Estimation using standard unit values
- Net weight can also be estimated using the same approach

Use of country provided information

- Quantity conversion using mathematical conversion
- Net weight is copied into the supplementary quantity, and vice-versa, in cases where only one of them is available
- FAO conversion factors for selected commodities applied during code normalization

Weighted Unit Value

Use partially reported quantity in the same commodity-flow

New Quantity = Value / Partially Reported Unit Value

Original Data							
HS Code	Description		Value	Quantity	Unit	WCO RU	
080810	Fresh Apple		100	50	5 (no of items)	8 (kilogram)	
080810	Fresh Apple		400	10	8 (kilogram)	8 (kilogram)	
080810	Fresh Apple		100	1	11 (dozen)	8 (kilogram)	

Original Data with share							
HS Code	Description	Value Share	Value	Quantity	Unit	WCO RU	UV
080810	Fresh Apple	33.33%	200	62	5 (no of items)	8 (kilogram)	3.2
080810	Fresh Apple	66.66%	400	10	8 (kilogram)	8 (kilogram)	40

Final data (estimated record is highlighted)							
HS Code	Description		Value	Quantity	Unit	WCO RU	UV
080810	Fresh Apple		200	5	8 (kilogram)	8 (kilogram)	40
080810	Fresh Apple		400	10	8 (kilogram)	8 (kilogram)	40

Standard Unit Value

Use standard unit value in the same commodity-flow

$$\text{New Quantity} = \text{Value} / \text{Standard Unit Value}$$

Original Data							
HS Code	Description		Value	Quantity	Unit	WCO RU	
080810	Fresh Apple		1000	50	5 (no of items)	8 (kilogram)	
080810	Fresh Apple		400	10	8 (kilogram)	8 (kilogram)	
080810	Fresh Apple		100	1	11 (dozen)	8 (kilogram)	

HS Code	Description	Value Share	Value	Quantity	Unit	WCO RU	UV
080810	Fresh Apple	73.33%	1100	62	5 (no of items)	8 (kilogram)	17.74
080810	Fresh Apple	26.66%	400	10	8 (kilogram)	8 (kilogram)	40

Standard Unit Value for HS Code 080810							
HS Code	Description	Flow	Unit	SUV	Low UV	High UV	
080810	Fresh Apple	Imports	8 (kilogram)	0.898	0.181	3.689	
080810	Fresh Apple	Exports	8 (kilogram)	0.655	0.249	1.863	

Final data (estimated record is highlighted)							
HS Code	Description		Value	Quantity	Unit	WCO RU	UV
080810	Fresh Apple		1100	1225	8 (kilogram)	8 (kilogram)	0.898
080810	Fresh Apple		400	10	8 (kilogram)	8 (kilogram)	40

Extreme quantity/weight and value data

Objective: to detect and remove extreme outliers in quantity

Three checks:

- Historical Unit Value Check
- Standard Unit Value Check
- Historical Value Check

Historical Unit Value (UV) Check

Quantity and weight unit values are considered extreme if

- $UV > \text{maximum historical unit value} * 10$, or
- $UV < \text{minimum historical unit value} / 10$
 - *Threshold: commodity flows above 0.005% of total export or import are considered*
 - *Historical unit values are the unit values of the last five years of the reporting country*

Example

CmdFlow	Unit	SUV	SUV	5V	Ratio	SUV
850423-2	5	33437.86<1.53<5195565.79			21,815.40	444,076.77
841861-1	80	3.99<0.00<62.16			4,517.88	15.71
151219-2	8	0.61<2168.77<2.05			1,055.98	1.09
710811-2	8	3441.01<10.42<139938.28			330.34	24,655.70
846019-2	80	1.68<21300.19<81.20			262.32	9.50
732111-1	5	9.64<0.04<1692.58	2.00<0.04<9.06		233.99	128.86

Outlier detected for imports commodity 732111, quantity provided in number of units (5)			
Calculated UV	0.04		
Minimum UV	9.64	Maximum UV	1692.58
Minimum UV / 10	0.9642	Maximum UV * 10	16,925.8
Is SUV < (Min UV / 10)	Yes	Is SUV > (Max UV * 10)	No

Standard Unit Value (SUV) Check

Quantity and weight unit values are considered extreme if

- $UV > \text{upper limit of standard unit value} * 2$, or
- $UV < \text{lower limit of standard unit value} / 2$
 - *Threshold: commodity flows greater than \$50,000*

Example

CmdFlow	Unit	SUV	SUV	5V	Ratio	SUV
850423-2	5	33437.86<1.53<5195565.79			21,815.40	444,076.77
841861-1	80	3.99<0.00<62.16			4,517.88	15.71
151219-2	8	0.61<2168.77<2.05			1,055.98	1.09
710811-2	8	3441.01<10.42<139938.28			330.34	24,655.70
846019-2	80	1.68<21300.19<81.20			262.32	9.50
732111-1	5	9.64<0.04<1692.58	2.00<0.04<9.06		233.99	128.86

Outlier detected for exports commodity 850423, quantity provided in number of units (5)

Calculated UV	1.53		
Minimum UV	33,437.86	Maximum UV	5,195,565.79
Minimum UV / 2	16,718.93	Maximum UV * 2	10,391,131.58
Is SUV < (Min UV / 2)	Yes	Is SUV > (Max UV * 2)	No

Historical Value Check

Values are considered extreme if

- Value $>$ maximum historical value \ast 100, or
- Value $<$ minimum historical value / 100
 - *Threshold: commodity flows greater than \$1,000,000*
 - *Historical values are the values of the last five years of a particular country.*

Data Aggregation

Data Aggregation in UN Comtrade

- We provide pre-aggregated data for our users
 - HS: 2, 4, 6 digit
 - SITC: 1, 3, 5 digit
 - BEC: 1, 2, 3 digit
- Partner “World”
- Commodity “Total”
- Future: add pre-aggregations on IMTS 2010 (extended data sets)

Welcome to the trade data extraction interface!

Keep an eye out for other [new features](#) being added based on your feedback!

Conversion of Commodity Classification

Data Conversion Objectives

- To provide comparable time series data in UN Comtrade for all countries in specific classification (i.e., HS 1988)
- Data reported in latest HS classification is converted to earlier versions of HS
- Use of WCO provided correlation tables between latest HS and previous HS version
- <https://unstats.un.org/unsd/trade/conversions/HS%20Correlation%20and%20Conversion%20tables.htm>

Illustration: relationships

Commodity correlation of Alcoholic Beverages

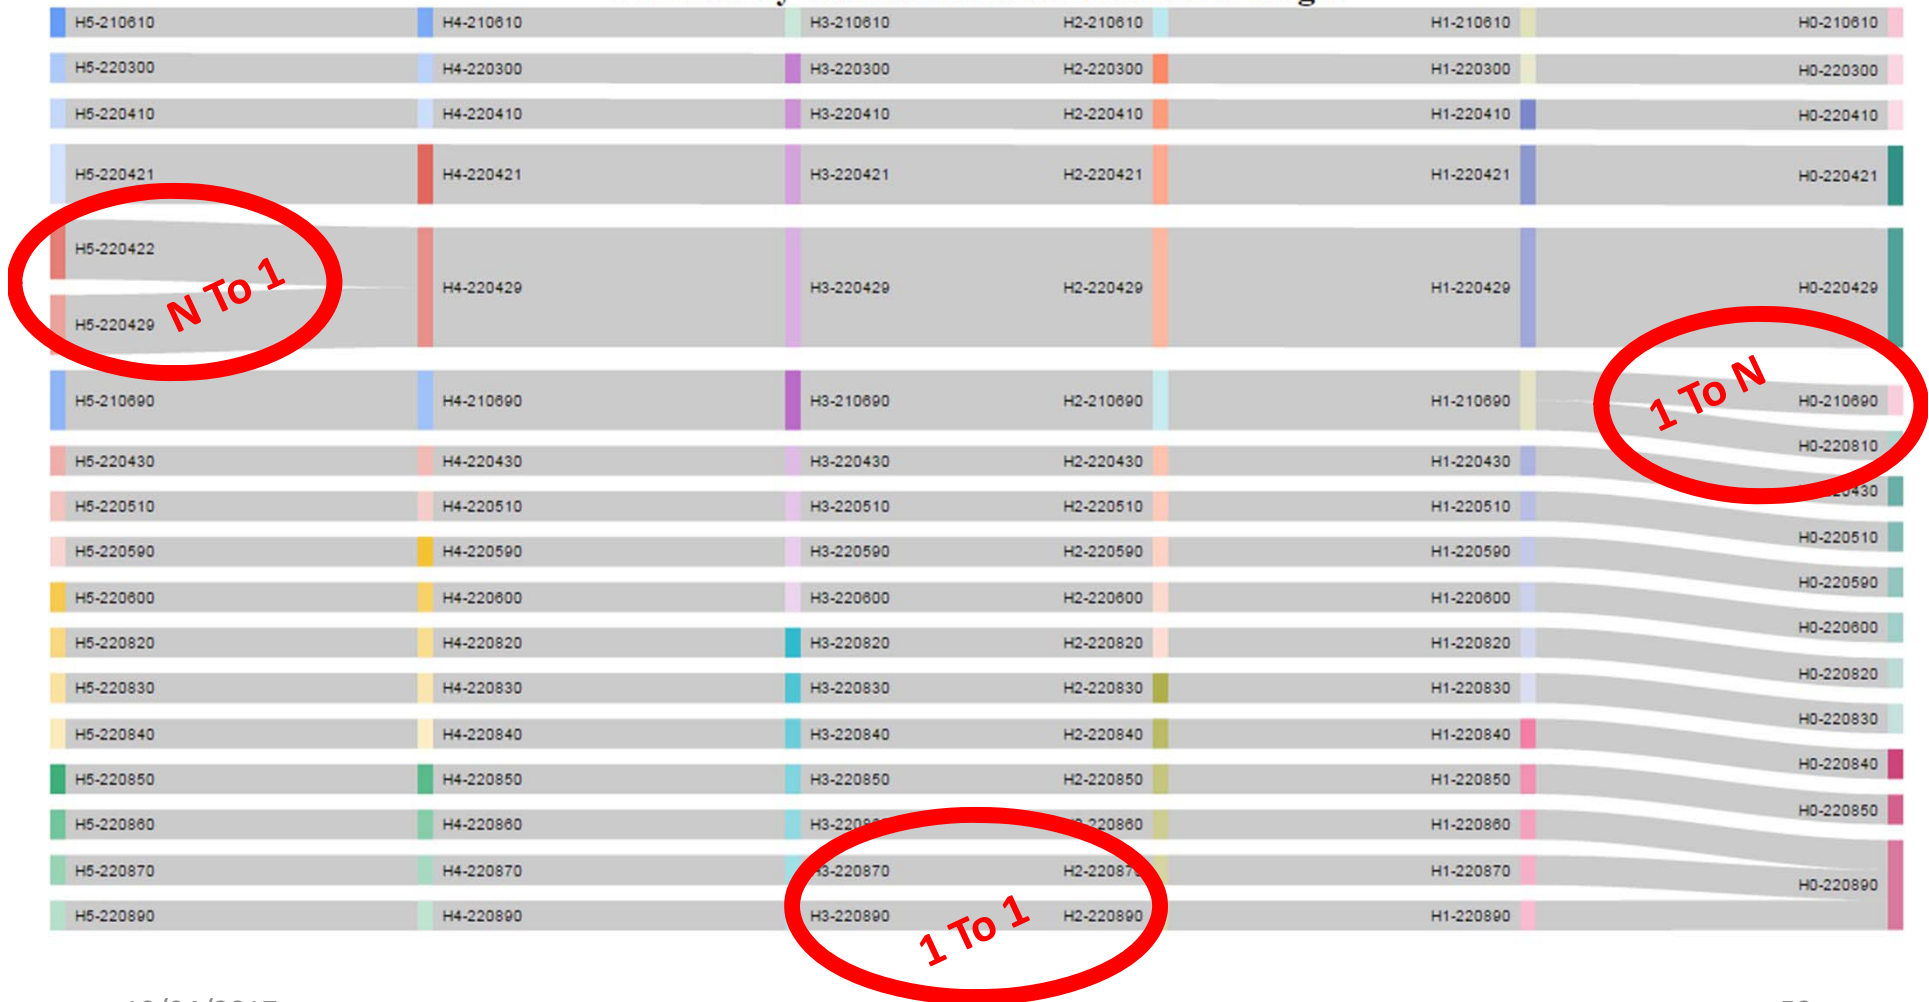

Illustration: relationships

Commodity correlation of "Automatic data processing machines (SITC 752)"

Method of conversion

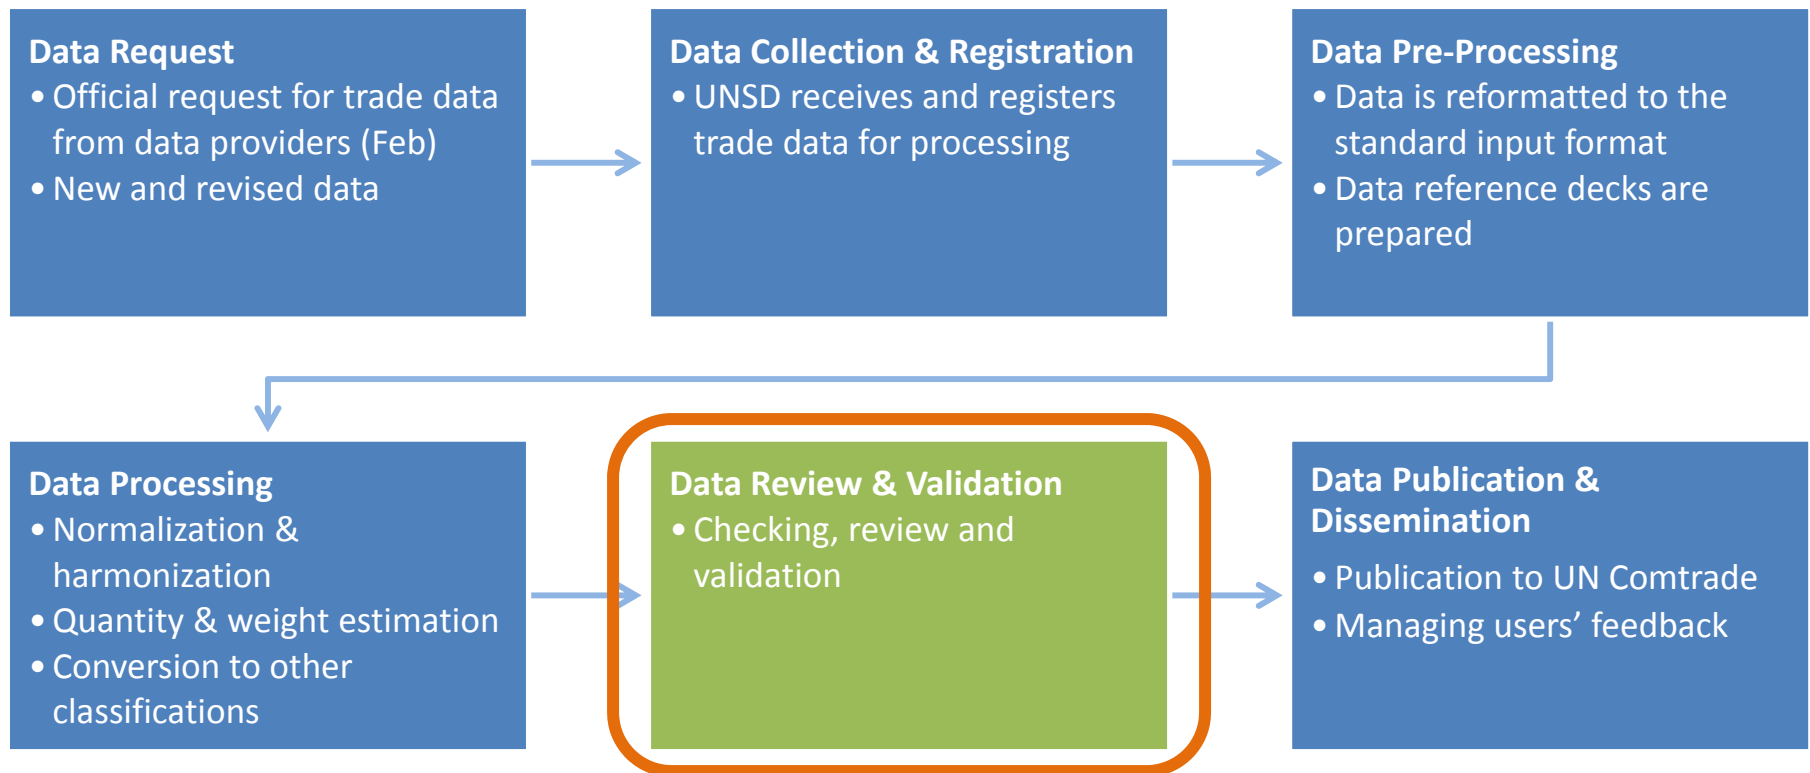

- Our practice is to convert most detailed level in original classification into one single code in the target classification, without splitting.
- The target code could be at detailed level or at higher level in aggregation structure
- We flatten 1:n and n:n to 1:1 and/or n:1 relationships

Correlation and Conversion of "Automatic data processing machines (SITC 752)"

Production Process: Data Review

Data Review and Validation

- Consolidated report (PDF) contains result of each processing phase
- Checklist
- Reviews both by editor and supervisor
- Reporting services

Table.4 HS Commodity Rejection

Version	# of rejections
H0	741
H1	504
H2	238
H3	2

• Data Import: Table1

- In CMDLENGTH, shows first indication of the existence of Reported High Level Data (any length less than 6).
- Length is usually even-numbered, but in some cases, odd-numbered. Possible cause is missing first digit '0' in the comm. code. Re-check if odd-numbered codes reported.
- Check missing flow
- Check unusual record counts for Quantity unit

• Data Import: Table4

- Shows the no. of rejected codes for each classification
- If no. of rejection between classifications do not differ that much, further investigation is required

Data Review

- Check overall totals against official sources, time series, trends
- Check level of memorandum items (overall value of non-standard commodity codes)
- Verify the mapping of partners, commodities and quantity units are correct
- Check integrity reports (possible wrong classification, conversion factors changed more than 1% from previous processing, export to itself, general trade system but data has free zones, partner world vs sum of individual partners)

Management Reports
