Bilateral asymmetries

Bilateral asymmetries in trade data (both in goods and services) are a well-known phenomenon in official statistics. Bilateral trade asymmetries occur when the reported exports from country A to country B do not match the reported imports to country B from country A.

Merchandise Trade

Three main and well-known reasons for asymmetries in bilateral merchandise trade are:

(i) the application of different criteria of partner attribution in import and export statistics
(ii) the use of CIF-type values in import statistics and FOB-type values in export statistics
(iii) application of different trade systems in data compilation.

International Merchandise Trade Statistics: Concepts and Definitions 2010 (IMTS 2010) was adopted by the UN Statistical Commission in 2010 and contains the following recommendations regarding partner attribution: (a) in the case of imports, the country of origin should be recorded; (b) in the case of exports, the country of last known destination should be recorded. It is important to note that whereas on the imports side, compilers of trade statistics can trace the country of origin, it is sometimes impossible to trace the country of final destination when the goods leave a country. IMTS 2010 clearly states that such partner attribution is not ideal. It explicitly warns that there are limitations to the use of data compiled on a country-of-origin basis; most notably, such an approach does not permit a symmetrical recording of the same trade transactions by the exporting country and the importing country and that this creates incomparability and detracts from the usefulness of such trade data for some types of economic analysis. The awareness of this limitation led the IMTS Expert Group to propose that country of consignment is also included in IMTS 2010 as a possible partner attribution.

There are other valid reasons why the reported exports of one country may not coincide with the reported imports of its partner country, such as:

• Imports are reported in CIF-type values, and exports are reported in FOB-type values;
• Time lag between exports and imports; e.g., goods leaving country A in 2012 might only reach country B in 2013;
• Goods passing through third countries;
• Goods entering Customs warehousing for several months;
• Goods being classified differently;
• Countries having different trade systems (General versus Special Trade System);
• Goods passing through industrial processing zones may or may not be recorded by the exporting country.
